DISCLAIMER

Certain commercial entities, equipment, products, or materials may be identified in this document in order to describe an experimental procedure or concept adequately. Such identification is not intended to imply recommendation or endorsement by NIST or NCCoE, nor is it intended to imply that the entities, equipment, products, or materials are necessarily the best available for the purpose.

National Institute of Standards and Technology Special Publication 1800-3c, Natl. Inst. Stand. Technol. Spec. Publ. 1800-3c, 577 pages, September 2017, CODEN: NSPUE2

FEEDBACK

You can improve this guide by contributing feedback. As you review and adopt this solution for your own organization, we ask you and your colleagues to share your experience and advice with us.

Comments on this publication may be submitted to: abac-nccoe@nist.gov.

Public comment period: September 20, 2017 through October 20, 2017

All comments are subject to release under the Freedom of Information Act (FOIA).

1 NATIONAL CYBERSECURITY CENTER OF EXCELLENCE

- 2 The National Cybersecurity Center of Excellence (NCCoE), a part of the National Institute of Standards
- 3 and Technology (NIST), is a collaborative hub where industry organizations, government agencies, and
- 4 academic institutions work together to address businesses' most pressing cybersecurity issues. This
- 5 public-private partnership enables the creation of practical cybersecurity solutions for specific
- 6 industries, as well as for broad, cross-sector technology challenges. Through consortia under
- 7 Cooperative Research and Development Agreements (CRADAs), including technology partners—from
- 8 Fortune 50 market leaders to smaller companies specializing in IT security—the NCCoE applies standards
- 9 and best practices to develop modular, easily adaptable example cybersecurity solutions using
- 10 commercially available technology. The NCCoE documents these example solutions in the NIST Special
- 11 Publication 1800 series, which maps capabilities to the NIST Cyber Security Framework and details the
- 12 steps needed for another entity to recreate the example solution. The NCCoE was established in 2012 by
- 13 NIST in partnership with the State of Maryland and Montgomery County, Md.
- To learn more about the NCCoE, visit https://nccoe.nist.gov. To learn more about NIST, visit
- 15 https://www.nist.gov.

16 NIST CYBERSECURITY PRACTICE GUIDES

- 17 NIST Cybersecurity Practice Guides (Special Publication Series 1800) target specific cybersecurity
- challenges in the public and private sectors. They are practical, user-friendly guides that facilitate the
- 19 adoption of standards-based approaches to cybersecurity. They show members of the information
- security community how to implement example solutions that help them align more easily with relevant
- 21 standards and best practices and provide users with the materials lists, configuration files, and other
- information they need to implement a similar approach.
- 23 The documents in this series describe example implementations of cybersecurity practices that
- 24 businesses and other organizations may voluntarily adopt. These documents do not describe regulations
- or mandatory practices, nor do they carry statutory authority.

26 **ABSTRACT**

- 27 Enterprises rely upon strong access control mechanisms to ensure that corporate resources (e.g.,
- 28 applications, networks, systems, and data) are not exposed to anyone other than an authorized user. As
- 29 business requirements change, enterprises need highly flexible access control mechanisms that can
- 30 adapt. The application of attribute based policy definitions enables enterprises to accommodate a
- 31 diverse set of business cases. This NCCoE practice guide details a collaborative effort between the
- 32 NCCoE and technology providers to demonstrate a standards-based approach to attribute based access
- 33 control (ABAC).
- 34 This guide discusses potential security risks facing organizations, benefits that may result from the
- 35 implementation of an ABAC system, and the approach the NCCoE took in developing a reference
- 36 architecture and build. It includes a discussion of major architecture design considerations, an
- 37 explanation of security characteristic achieved by the reference design, and a mapping of security
- 38 characteristics to applicable standards and security control families.

- 39 For parties interested in adopting all or part of the NCCoE reference architecture, this guide includes a
- detailed description of the installation, configuration, and integration of all components.

41 **KEYWORDS**

- 42 access control; access management; attribute provider; authentication; authorization; identity
- 43 federation; identity management; identity provider; relying party

44 ACKNOWLEDGMENTS

We are grateful to the following individuals for their generous contributions of expertise and time.

Name	Organization
Nate Lesser	NIST National Cybersecurity Center of Excellence
Paul Timmel	NIST National Cybersecurity Center of Excellence
Paul Grassi	NIST National Strategy for Trusted Identities in Cyberspace
Mike Garcia	NIST National Strategy for Trusted Identities in Cyberspace
Naomi Lefkovitz	NIST National Strategy for Trusted Identities in Cyberspace

- The Technology Partners/Collaborators who participated in this build submitted their capabilities in
- 47 response to a notice in the Federal Register. Respondents with relevant capabilities or product
- components were invited to sign a Cooperative Research and Development Agreement (CRADA) with
- 49 NIST, allowing them to participate in a consortium to build this example solution. We worked with:

Technology Partner/Collaborator	Build Involvement
Ping Identity	PingFederate Federation Server
<u>NextLabs</u>	Entitlements Management Policy Enforcement Point
Microsoft	Policy Controller Policy decision point
RSA	Control Center Policy Administration Point

Technology Partner/Collaborator	Build Involvement
Symantec	Active Directory

300	1	Introduction			
301 302 303 304	The following guides show IT professionals and security engineers how we implemented this example solution. We cover all of the products employed in this reference design. We do not recreate the product manufacturers' documentation, which is presumed to be widely available. Rather, these guides show how we incorporated the products together in our environment.				
305 306		These are not comprehensive tutorials. There are many possible service and security configurations are products that are out of scope for this reference design.			
307	1.1	Practice Guide Structure			
308 309 310	users	IST Cybersecurity Practice Guide demonstrates a standards-based reference design and provides with the information they need to replicate an Attribute Based Access Control (ABAC) mentation. This reference design is modular and can be deployed in whole or in parts.			
311	This guide contains three volumes:				
312		NIST SP 1800-3a: Executive Summary			
313		NIST SP 1800-3b: Approach, Architecture, and Security Characteristics – what we built and why			
314		NIST SP 1800-3c: How-To Guides – instructions for building the example solution (you are here)			
315	Depen	ding on your role in your organization, you might use this guide in different ways:			
316 317	Business decision makers, including chief security and technology officers will be interested in the <i>Executive Summary (NIST SP 1800-3a)</i> , which describes the:				
318		challenges enterprises face in access control solutions			
319		example solution built at the NCCoE			
320		benefits of adopting the example solution			
321 322 323	Technology or security program managers who are concerned with how to identify, understand, assess and mitigate risk will be interested in this part of the guide, <i>NIST SP 1800-3b</i> , which describes what we did and why. The following sections will be of particular interest:				
324		Section 4.4.1, Risk, provides a description of the risk analysis we performed			
325 326		Section 4.4.3, Security Control Map, maps the security characteristics of this example solution to cybersecurity standards and best practices			
327 328		ight share the Executive Summary, NIST SP 1800-3a, with your leadership team members to help understand the importance of adopting standards-based ABAC implementation.			
329 330 331 332 333 334	You ca create integra manuf	fessionals who want to implement an approach like this will find the whole practice guide useful. In use the How-To portion of the guide, NIST SP 1800-3c, to replicate all or parts of the build d in our lab. The How-To guide provides specific product installation, configuration, and ation instructions for implementing the example solution. We do not recreate the product facturers' documentation, which is generally widely available. Rather, we show how we orated the products together in our environment to create an example solution.			

This guide assumes that IT professionals have experience implementing security products within the enterprise. While we have used a suite of commercial products to address this challenge, this guide does not endorse these particular products. Your organization can adopt this solution or one that adheres to these guidelines in whole, or you can use this guide as a starting point for tailoring and implementing parts of an ABAC solution. Your organization's security experts should identify the products that will best integrate with your existing tools and IT system infrastructure. We hope you will seek products that are congruent with applicable standards and best practices. Volume B, Section 4.5, Technologies, lists the products we used and maps them to the cybersecurity controls provided by this reference solution.

A NIST Cybersecurity Practice Guide does not describe "the" solution, but a possible solution. This is a draft guide. We seek feedback on its contents and welcome your input. Comments, suggestions, and success stories will improve subsequent versions of this guide. Please contribute your thoughts to abac-ncce@nist.gov.

1.2 Build Overview

The following section provides detailed instructions for implementing, configuring and integrating an ABAC solution coupled with identity and attribute federation. These instructions detail an example of an ABAC implementation using a policy enforcement point that is closely coupled with a SharePoint file server and two sources of environmental attributes. Before implementing this reference design, individuals should refer to NIST SP 1800-3b *Approach*, *Architecture*, *and Security Characteristics* to better understand the design decision that we made as part of this implementation.

1.3 Typographical Conventions

355 The following table presents typographic conventions used in this volume.

Typeface/ Symbol	Meaning	Example
Italics	filenames and pathnames references to documents that are not hyperlinks, new terms, and placeholders	For detailed definitions of terms, see the NCCoE Glossary.
Bold	names of menus, options, command buttons and fields	Choose File > Edit .
Monospace	command-line input, on- screen computer output, sample code examples, sta- tus codes	mkdir
Monospace Bold	command-line user input contrasted with computer output	service sshd start

Typeface/ Symbol	Meaning	Example	
<u>blue text</u>	link to other parts of the document, a web URL, or an email address	All publications from NIST's National Cybersecurity Center of Excellence are available at http://nccoe.nist.gov

2 Setting Up the Identity Provider

- This guide details an attribute based access control (ABAC) implementation that leverages identity federation. In a federation model, the identity provider (IdP) authenticates the user requesting access and provides attributes assigned to that user to the relying party (RP). In addition to attributes assigned to the user, the IdP sends environmental and device attributes to the RP. The RP, which controls access to the resource requested by the user, utilizes the identity and attributes information to make runtime decisions to grant or deny access to the user.
- In this section, we install and configure federation components at the identity provider. The
 components in this section facilitate federated, Security Assertion Markup Language (SAML)-based
 authentication using account credentials in the identity provider's Microsoft Active Directory Domain
 Services (referred to as Microsoft AD in this guide). The federated authentication between the RP and
 IdP is facilitated by Ping Identity's PingFederate application. This build also requires the user to
 authenticate with a second factor, which is handled by the RSA adaptive authentication server.
- Each of the components used for the build are described in the Components section. Following the Components section are step-by-step instructions for installing, configuring, and integrating the components.
- If you follow the instructions in this section, you will be able to perform a Functional Test to verify the successful completion of the steps for installing, configuring, and integrating the components.

2.1 Components

- Federated Authentication at the IdP involves the following distinct components:
 - Cisco Switch (Catalyst 2960-X Series): Acts as a switch and router in the build, routing traffic from users to the services and applications on another network segment
 - Cisco Identity Services Engine (ISE): Authenticates users from other networks or network segments, and provides device and network attributes to the Ping-Federate IdP via the Situational Context Connector
 - Microsoft AD: An LDAP directory service that stores user account and attribute information
 - Nginx Web Server: A web server installed on a separate host that is required for handling Network Access Device (NAD) redirects for the Situational Context Connector. In this build, we used Nginx.
 - PingFederate-IdP: A federation system or trust broker for the IdP
 - PingFederate-RP: Serves as the trust broker for SharePoint

- RSA Adaptive Authentication (RSA AA): Requires the user to authentication using a Short Message Service (SMS) message sent to the user's mobile phone. Collects environmental information about the user and the user's system or agent at the time of authentication.
- 391 SCE Plug-in: Handles communications between the PingFederate-IdP and the RSA AA
- Situational Context Connector: IdP Adapter for PingFederate that integrates PingFederate with
 the Cisco Identity Server Engine via the pxGrid Application Programming Interface (API)

2.1.1 Cisco Switch and Cisco Identity Services Engine

- 395 The Cisco Catalyst 2960-X Series switch serves as a switching and routing device, primarily for the
- 396 purpose of routing users' traffic from one network or network segment to another, where the protected
- 397 resources and services are located. The Cisco ISE authenticates users whose traffic comes from the
- switch, and from that authentication provides device and network attributes to the PingFederate IdP via
- 399 the Situational Context Connector.

400 2.1.2 Microsoft AD

- 401 Microsoft AD acts as a user identity management repository for the IdP. It includes the ability to
- 402 provision and de-provision user identities; the creation, modification, and deletion of subject attributes;
- and the provisioning and de-provisioning of subject attributes to specific user identities. In this build,
- 404 Microsoft AD is the only source for subject attributes from the IdP.

405 2.1.3 Nginx Web Server

- 406 Nginx acts as a web server that handles NAD redirects for the Situational Context Connector. It is used to
- 407 trigger the NAD (Cisco Switch in this case) to insert the session identification (ID) as a parameter to
- 408 create a secure browser cookie, which gets returned to PingFederate and then verified by the Context
- 409 Connector during authentication. When the Context Connector matches the session ID from the secure
- 410 browser cookie with the session ID from Cisco ISE, federation can continue, and a Security Assertion
- 411 Markup Language (SAML) response is returned to the browser. Finally, the browser POSTs a SAML
- 412 response to the PingFederate-RP.

413 2.1.4 PingFederate-IdP

- 414 Ping Identity PingFederate-IdP serves as a federation system or trust broker for the IdP. PingFederate-
- IdP provides initial user authentication and retrieval of user attributes to satisfy SAML requests from the
- 416 RP. Once the user has been authenticated, PingFederate-IdP queries subject attributes from AD and
- 417 environmental attributes from the RSA AA event log. PingFederate-IdP packages both subject and
- environmental attributes in a SAML 2.0 token to be sent to the RP.

PingFederate Usage Notes:

419

420

421

422

423

424

When using the PingFederate application to perform an administrative configuration, there is usually a sequence of screens that require user entry, ending with a summary page. Once you click Done on the summary page, you must also click Save on the following page to actually save the configurations. If you forget to click Save, you may inadvertently lose changes to the configuration.

428

429

430

437

450

- In the PingFederate application and associated documentation, the RP is referred to as the Service Provider.
 - When using the PingFederate application to perform configuration, refer to the title of the tab with a small star icon to its left to identify the item you are currently configuring. For example, if you navigated to the following screen, you would be on the IdP Adapter screen.

431 2.1.5 PingFederate-RP

- Ping Identity PingFederate-RP serves as the trust broker for SharePoint. When the user requires
- authentication, PingFederate-RP redirects the user to the IdP via a SAML request to get the necessary
- assertions. Once authenticated, PingFederate-RP arranges for the browser's Hypertext Transfer Protocol
- 435 Secure (HTTPS) content to have the proper information in proper format for acceptance at the target
- 436 resource (SharePoint).

2.1.6 RSA Adaptive Authentication

- 438 RSA AA gathers environmental information about the user and the user's system or agent at the time of
- authentication. RSA AA collects information such as patch level, operating system, and location, and it
- generates a risk score associated with the user authentication. A risk score threshold can then be
- defined in RSA AA, which, if exceeded, can force a user to step up to one of the additional
- authentication mechanisms. In this build, information collected by RSA AA to generate a risk score is also
- passed through PingFederate-IdP to the RP side of the operation to be used as environmental attributes.
- The RSA AA event log contains the transaction ID of each user authentication and the associated
- environmental information collected by RSA AA at the time of authentication.

446 2.1.7 SCE Plug-in

- 447 The SCE Plug-in handles communications between the PingFederate-IdP and the RSA AA. It is
- responsible for passing the RSA AA transaction ID for the user authentication that PingFederate-IdP uses
- 449 to guery the RSA AA event log.

2.1.8 Situational Context Connector

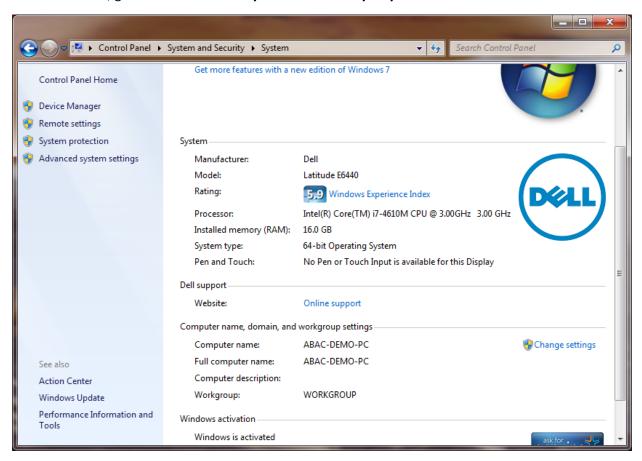

- 451 The Situational Context Connector is an IdP adapter for PingFederate that integrates PingFederate with
- 452 the Cisco Identity Server Engine via the pxGrid API. Deploying this solution for PingFederate enables
- 453 device-level authentication and authorization for web single sign-on (SSO) use cases. When a user
- 454 attempts a SSO via PingFederate, the Context Connector queries Cisco ISE, retrieves the device context
- 455 for the end-user device, and matches device context with the credentials of an authenticated user. The
- 456 result is a session based on a combination of user and device information. The Context Connector
- 457 enables real-time evaluation of Cisco ISE state-of-the-art device profiling. The Context Connector can
- 458 provide information about the user and the session to the PingFederate IdP, which the PingFederate IdP
- 459 includes in the SAML token sent to the PingFederate RP. The Context Connector relies on a web server
- 460 for NAD redirects (implemented with Nginx on a separate server in this build), and a Session Validator
- that is included in the Situation Context Connector integration kit.

2.1.9 Required or Recommended Files, Hardware, and Software

Component	Required Files	Recommended or Minimum Hardware Requirements	Hardware Used in this Build	Recommended or Mini- mum Operating System or Other Software	Operating System or Other Software Used in this Build
Cisco ISE 2.1 (as Virtual Appliance)	ise- 2.1.0.474.SPA.x86_64.iso	16GB RAM; 6 cores, 2GHz or faster; 200 GB free disk space	16GB RAM; 4 cores, 2GHz; 200 GB hard disk space	N/A	N/A
Microsoft AD	N/A	512MB RAM; 1.4GHz CPU; 32GB free disk space	4GB RAM; 2.2GHz CPU; 108GB free disk space	N/A	Microsoft Windows Server 2012
PingFederate	N/A	4GB RAM; 4 cores; 1.8 GHz or faster; 750 MB free disk space	4GB RAM; 2.2GHz CPU; 98 GB	Microsoft Windows Server 2008 R2	Microsoft Windows Server 2012
SCE Plug-in	sce-adapters-pingfeder- ate-aa.1.1.jar	1GB RAM; 1.8GHz CPU; 250MB free disk space	4GB RAM; 2.2GHz CPU; 98 GB	N/A	Microsoft Windows Server 2012

464 2.2 Configuring I PC for 802.1x Auth

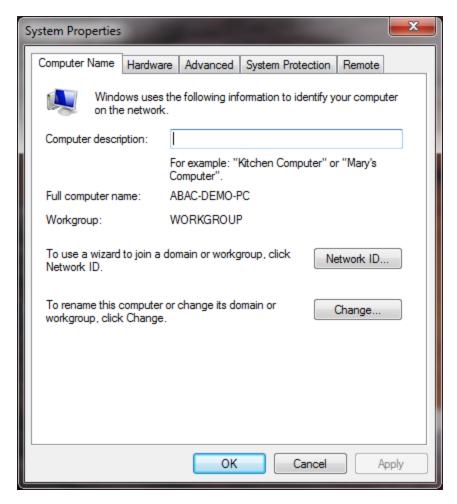

1. On the client PC, go to Control Panel > System and Security > System.

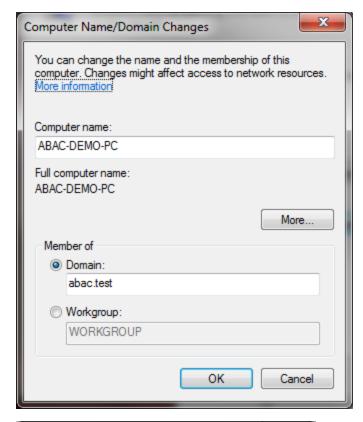

466

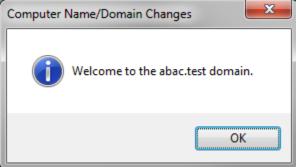

465

467 2. Click on Change settings.

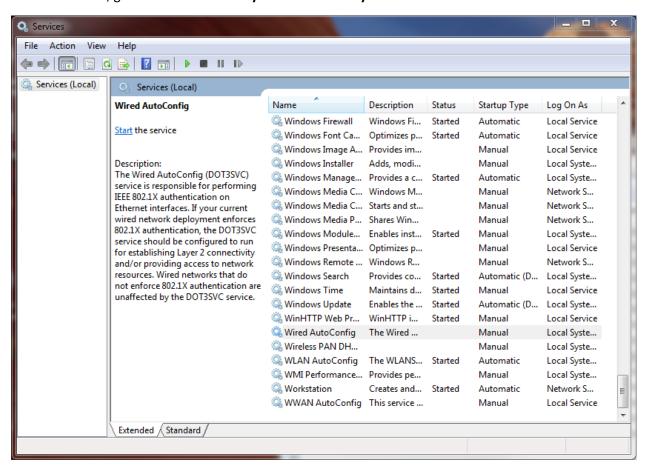

- 468
- 469 3. Click on the **Change button.**
- 470 4. Select **Domain.**
- 5. Enter the domain to join, "abac.test." It will require authentication using a user that' is capable of adding a computer to the domain controller.

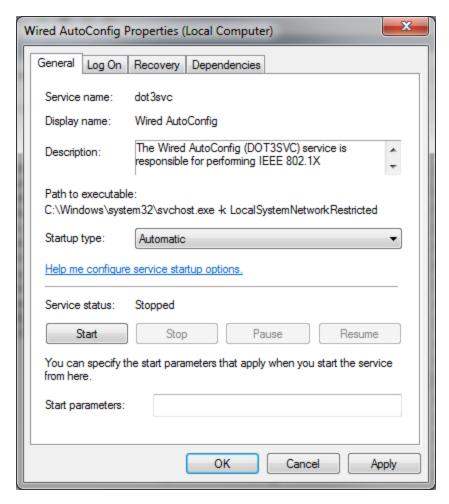

475 2.2.1 Configure MS Native Supplicant for Wired 802.1x

1. On the client PC, go to Control Panel > System and Security > Administrative Tools > Services.

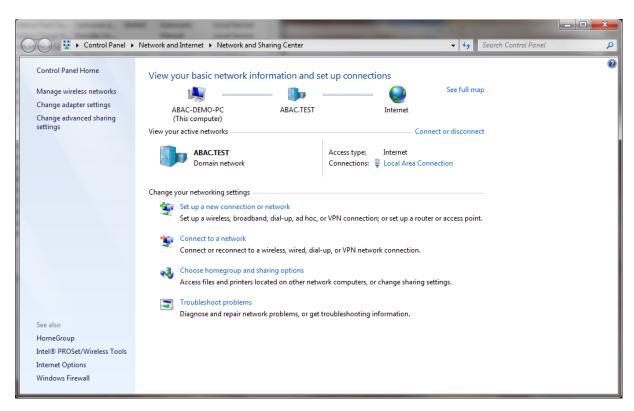

477

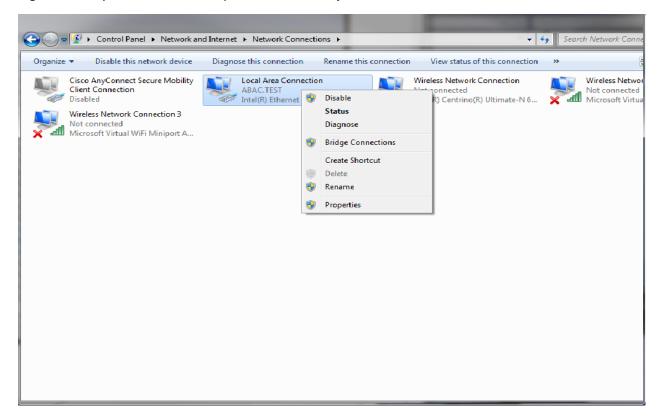

- 478 2. Right-click on Wired AutoConfig.
- 479 3. Select **Properties.**
- 480 4. Change the **Startup type** to **Automatic.**

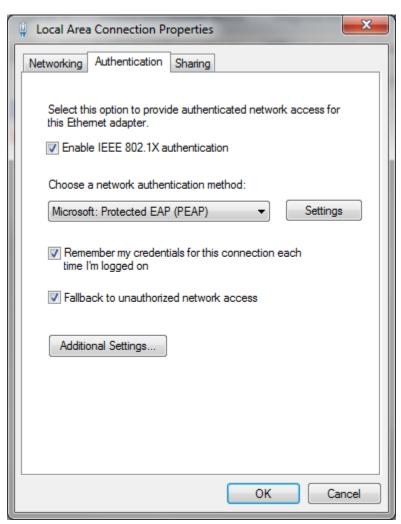

- 482 5. Click **Apply.**
- 483 6. Click **OK.**
- 7. Go to Control Panel > Network and Internet > Network and Sharing Center.

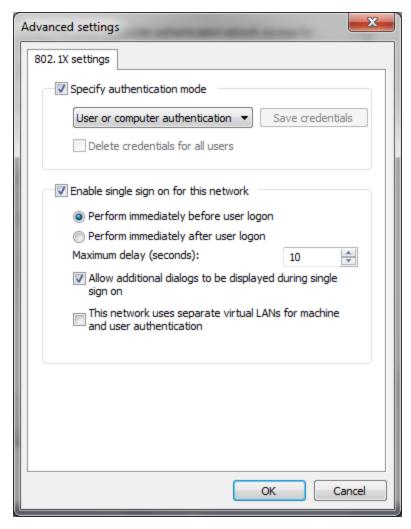

- 485
- 486 8. Click on Change adapter settings.
- 9. Right-click on your connection adapter and select **Properties.**

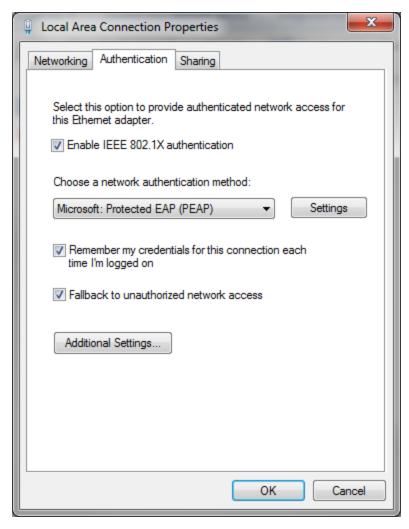

489 10. Click the **Authentication** tab.

- 491 11. Click on Additional Settings.
- 492 12. Check the **Specify Authentication Mode** checkbox.
- 493 13. Select User of computer authentication.
- 494 14. Check the **Enable single sign on for this network** checkbox.

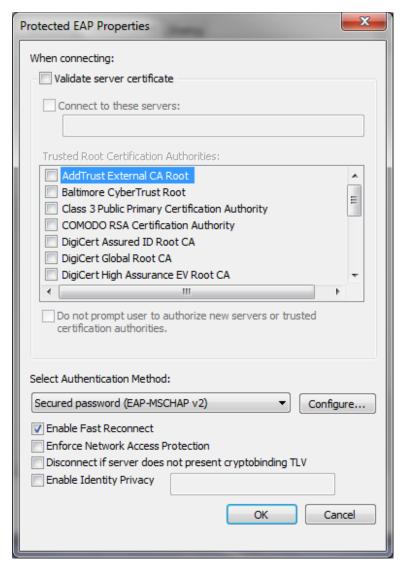

- 15. Click **OK.**
- 497 16. Click on **Settings** next to **Microsoft: Protected EAP (PEAP).**

499

17. Uncheck Validate server certificate.

501

502

18. Click **OK** and proceed back to the desktop and log out.

2.3 Install Nginx Web Server

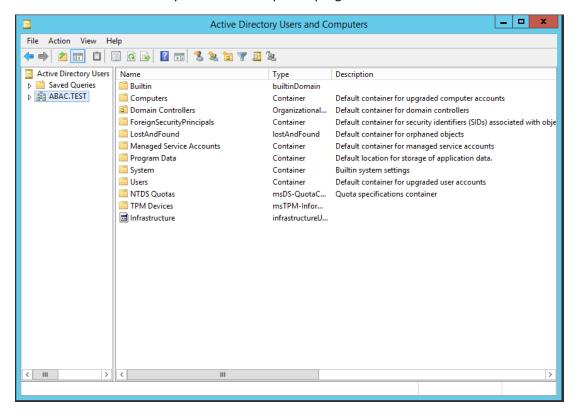

- A web server is required for NAD redirects during the Situational Context Connector's authentication flow. In our build, we implemented the web server using Nginx.
- 1. Log on to the server that will host the Nginx web server.
- 2. Follow the instructions at the link below to install Nginx on Windows.
- 507 http://nginx.org/en/docs/windows.html

2.4 Install Microsoft AD

- 509 Log on to the server that will host Microsoft AD.
- 510 1. Follow the instructions at the link below to create a new Microsoft AD domain that will store the accounts and identity information for the identity provider.
- 512 2. During setup, you will be asked to provide a name for your new domain.
 513 The name of the domain used for this build is **ABAC.TEST**.
- 514 https://technet.microsoft.com/en-us/library/jj574166.aspx

515 2.4.1 Create a User in Microsoft AD

- 516 To create a user account in the Microsoft AD Domain:
- 1. Launch the Active Directory Users and Computers program.

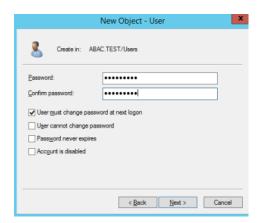

- 518
- 2. Click on the name of your domain in the left pane and then right-click on the Users folder in the right pane. In this guide, the name of the domain is "ABAC.TEST."
- 3. In the pop-up menu that appears, select New, and then select User.
- 4. In the New Object User screen that appears, type the **First** and **Last** name of the user, as well as their **User logon name** (that is, the account name).

526

527528

- 5. Click Next.
- 6. In the password screen that appears, type in the user's initial password. Then, type it again in the **Confirm password** field. When users log in for the first time, they will be prompted to create their own unique password.

529530

531

532

533

- 7. Click Next.
- 8. In the confirmation screen with information about the new user that appears, click **Finish** to complete the operation.
- When the user logs on to the domain for the first time, the user will be prompted to create a new, unique password.
- The following illustrations demonstrate what the new password screens may look like on
 Microsoft Windows Server 2012 when the user Lucy Smith attempts to log on to a computer in
 the **ABAC.TEST** domain using her user name **Ismith** and the initial password.

540

541

When Lucy clicks **OK**, she will see the screen below. She will type in her new password, which adheres to the organization's password strength policy; then she will type the password in again to confirm.

542

543

544

545

546547

548

549

552

When she presses Enter, Microsoft Windows will change her password.

2.4.2 Create the Lightweight Directory Access Protocol User for Federated Authentication

Follow the steps in the previous section to create a user named Lightweight Directory Access Protocol (LDAP) user in Microsoft AD. The PingFederate-IdP will use this user account to perform LDAP queries in Microsoft AD.

2.4.3 Create the LDAP User for Cisco ISE Administration

- Follow the steps in the previous section to create a user named ciscoise svc account in Microsoft AD.
- The Cisco ISE will use this user account to perform LDAP queries in Microsoft AD.

2.5 Configure the Cisco Switch

- 553 The Cisco Switch is configured in this build to represent realistic network segmentation separating users
- and protected network components and services on the IdP's network. Two virtual local area networks
- 555 (VLANs) are configured, and traffic is routed between the user VLAN and the services VLAN.

1. Complete the initial setup of the switch with the *Running Express Setup* instructions found in the document "Getting Started Guide for the Catalyst 2960-X and 2960-XR Switches," available at the link below.

http://www.cisco.com/c/en/us/td/docs/switches/lan/catalyst2960xr/hardware/quick/guide/bgsg 2960xr.html#task 0410FE6F6E3B4D9EB6175EBE40A03FD0

2. The switch in our build is configured as seen below.

2.6 Install and Configure Cisco Identity Services Engine

- 1. On a Redhat or CentOS server, boot from the Cisco ISE iso file.
- 783 2. At the installation screen, choose your boot option and press **Enter**.

```
Welcome to the Cisco Identity Services Engine Installer Cisco ISE Version: 2.1.0.474

Available boot options:

[1] Cisco ISE Installation (Keyboard/Monitor)
[2] Cisco ISE Installation (Serial Console)
[3] System Utilities (Keyboard/Monitor)
[4] System Utilities (Serial Console)

<Enter> Boot existing OS from hard disk.

Enter boot option and press <Enter>.

boot: 1_
```

3. Once installation is complete, it restarts. Enter **setup** and press **Enter**.

786 787

788 789 4. Enter ISE configuration information (ISE hostname, Internet Protocol [IP] addresses, domain name service [DNS] domain and name servers, Network Time Protocol [NTP] server, time zone, username, and password):

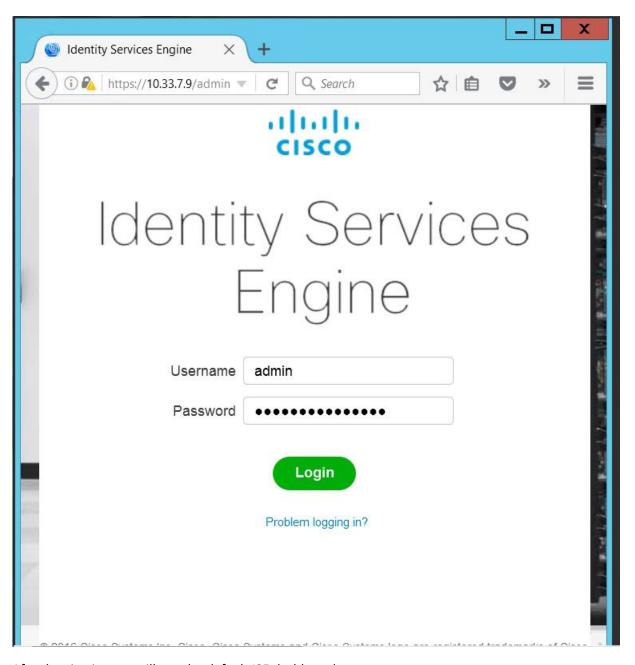

```
Press 'Ctrl-C' to abort setup
Enter hostname[]: ABAC-CiscoISE
Enter IP address[]: 10.33.7.9
Enter IP netmask[]: 255.255.255.0
Enter IP default gateway[]: 10.33.7.1
Enter default DNS domain[]: abac.test
Enter primary nameserver[]: 10.33.7.230
Add secondary nameserver? Y/N [N]: Y
Enter secondary nameserver[]: 8.8.8.8
Add tertiary nameserver? Y/N [N]: Y
Enter tertiary nameserver[]: 8.8.4.4
Enter NTP server[time.nist.gov]: 129.6.15.30
Add another NTP server? Y/N [N]: N
Enter system timezone[UTC]: EST
Enable SSH service? Y/N [N]: Y
Enter username[admin]: admin
Enter password:
Enter password again:
Copying first CLI user to be first ISE admin GUI user...
Bringing up network interface...
```

790 791

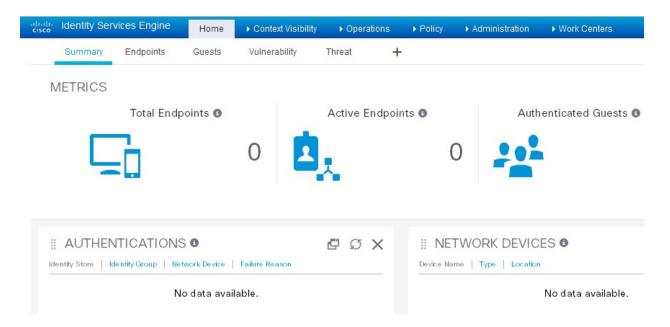

792

793

5. ISE will continue and create the database. ISE will automatically reboot after a successful installation. After the reboot, you can log in to ISE via any browser reachable in your domain by entering <a href="https://cipaddice.com/https://c

6. After logging in, you will see the default ISE dashboard:

2.6.1 Configure Cisco ISE with Microsoft AD

- 1. While logged in to the ISE administration console, navigate to **Administration > Identity Management > External Identity Sources > Active Directory**.
- Follow the instructions at the link below, beginning on page 11, Steps 1-9, to configure Cisco ISE with Microsoft AD. Note: these instructions are in the section Testing Environment > Cisco Identity Service Engine (ISE 2.0) VM Setup > Initial ISE Setup > AD User Setup.
 - https://developer.cisco.com/fileMedia/download/01d139d2-c08a-4f5d-a0ce-8d0473a021d9
- 3. Note: At step 3, provide the credentials of the user account created earlier to join ISE to the existing AD domain (eg, ciscoise_svc_account).

2.6.2 Add Network Device to ISE

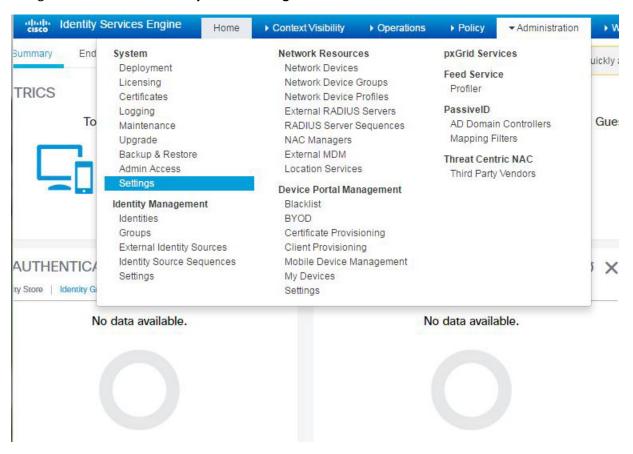

- Follow the instructions at the link below, beginning on page 14, Steps 1-3, to register the NAD with ISE. Note: these instructions are in the section Testing Environment > Cisco Identity
 Service Engine (ISE 2.0) VM Setup > Initial ISE Setup > Network Devices.
 - https://developer.cisco.com/fileMedia/download/01d139d2-c08a-4f5d-a0ce-8d0473a021d9
- 2. Note: The shared secret used on Step 2, "Enable Radius Authentication Settings and enter the shared secrets," must be the same key that was used for configuring aaa on the switch. If the switch has not yet been configured, remember to record the secret used here so that it can be used when configuring aaa on the switch.

2.6.3 Configure ISE for pxGrid

Follow the instructions at the link below, beginning on page 15, Steps 1-4, to enable a pxGrid persona, used by the Situational Context Connector to query ISE for device and network attributes. Note: these instructions are in the section **Configuring ISE for pxGrid**.

819 2.6.4 Enable ISE Policy Sets

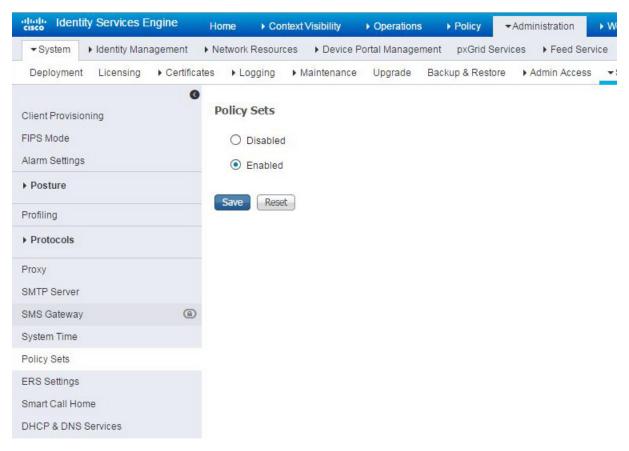

1. Navigate to Administration > System > Settings.

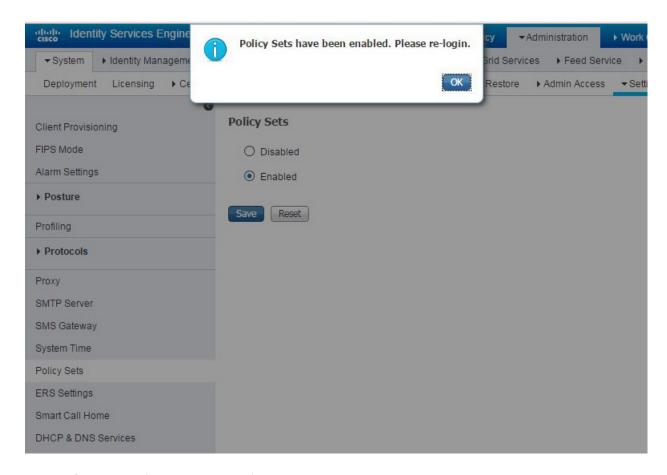

821822

820

2. In the left sidebar, click on Policy Sets.

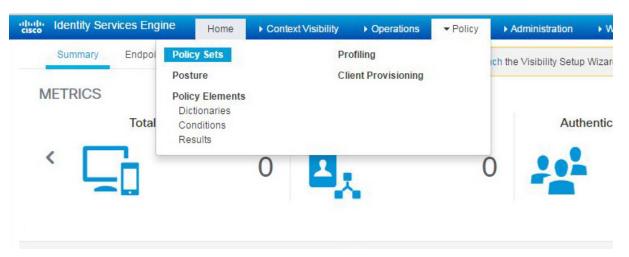

- 3. Click the **Enabled** radio button.
- 825 4. Click **Save.**
- 5. In the pop-up, click **OK** and log back into ISE.

829

828 2.6.5 Configure Authentication Policy

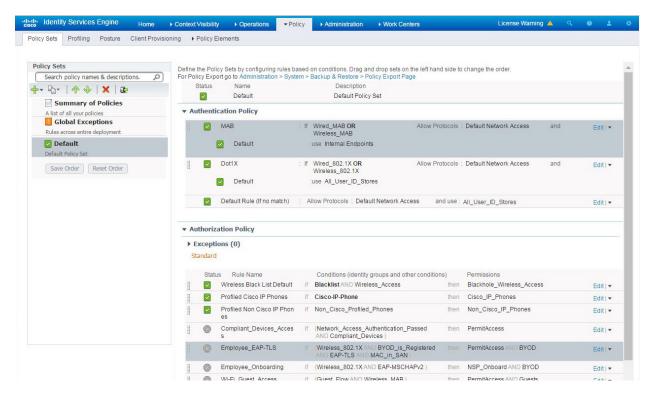

1. Navigate to Policy > Policy Sets.

830

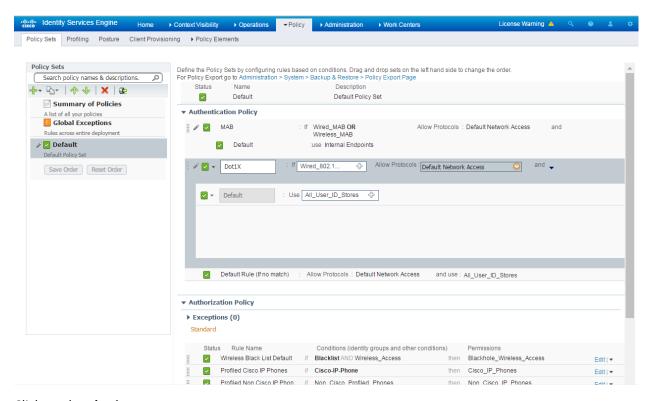

831

2. In the left sidebar, click on **Default.**

833

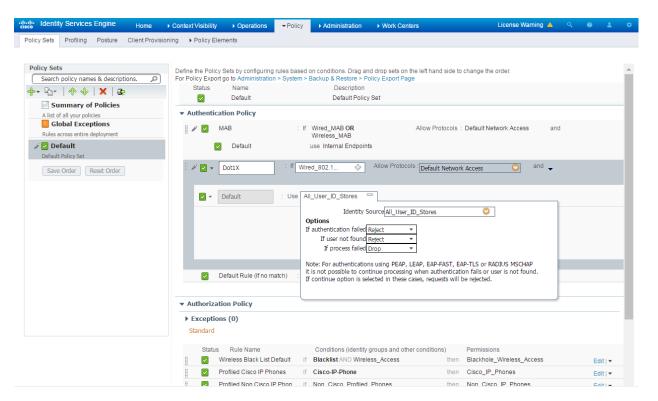

3. Click on the **Dot1x** rule.

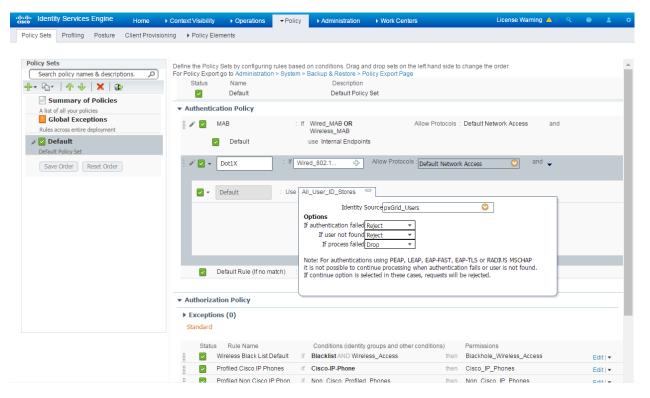

834835

4. Click on the plus icon.

838

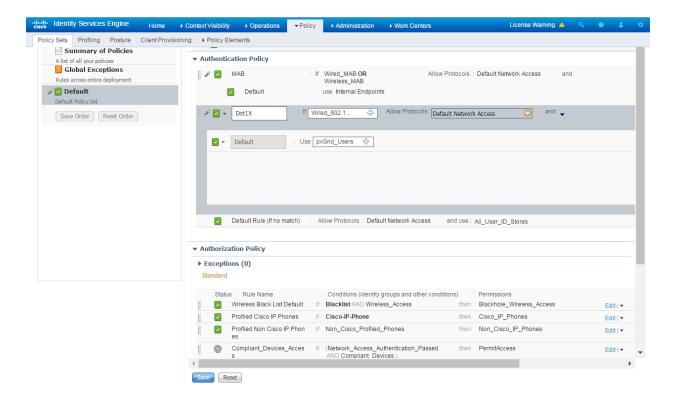

5. Change the value of **Identity Source** to "pxGrid_Users."

6. Scroll to the bottom of the page and click **Save.**

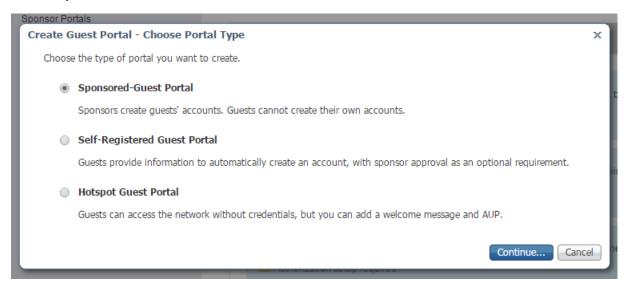

NIST SP 1800-3C: Attribute Based Access Control

842

841 2.6.6 Configure Authorization Policy

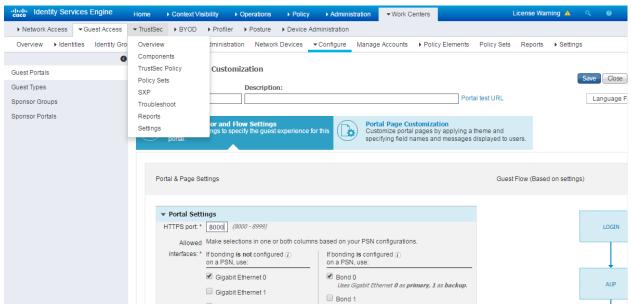

- 1. Navigate to Administration > Guest Access.
- 2. In the sidebar, click on **Guest Portals.**
- 3. Click Create.
- 4. Choose **Sponsored Guest Portal.**

846

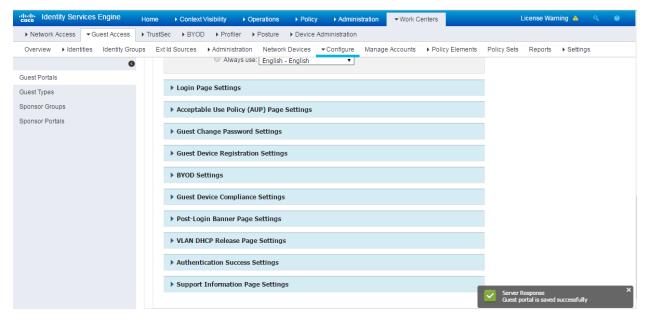

- Click Continue.
- 848 6. Provide a name, ABAC-Guest.

7. Under Portal settings, set the **HTTPS port** to **8000.**

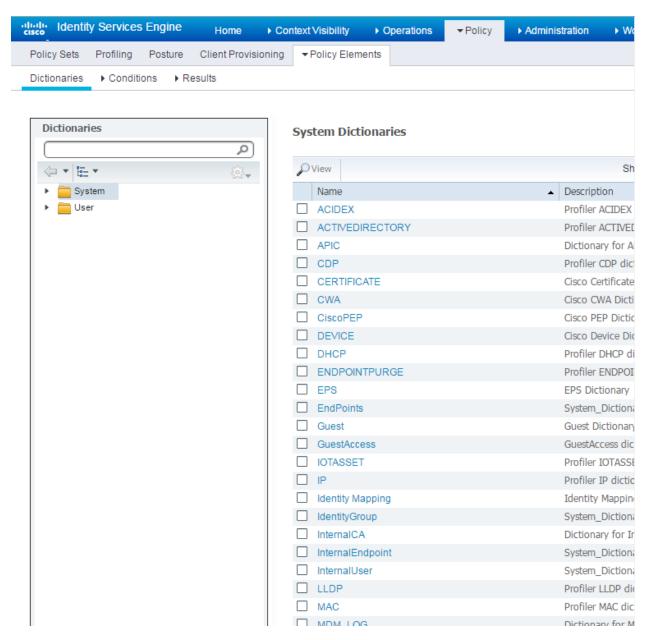

8508518. Click **Save.**

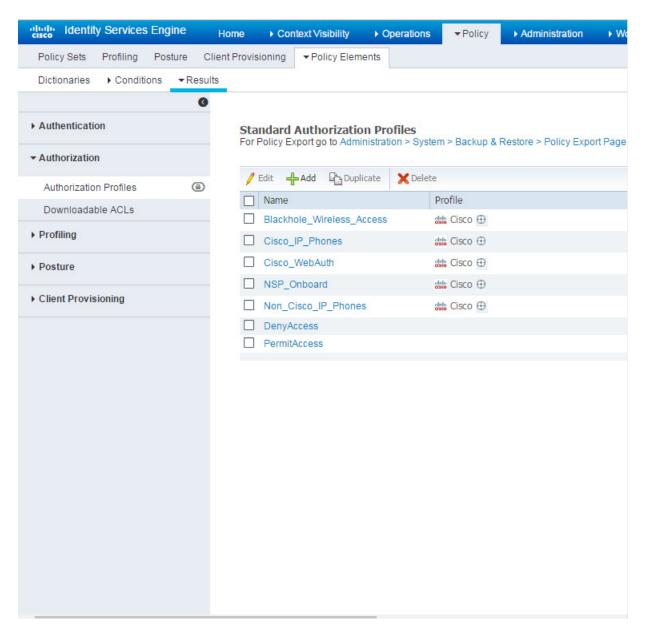

852

9. In the main menu, navigate to **Policy > Policy Elements.**

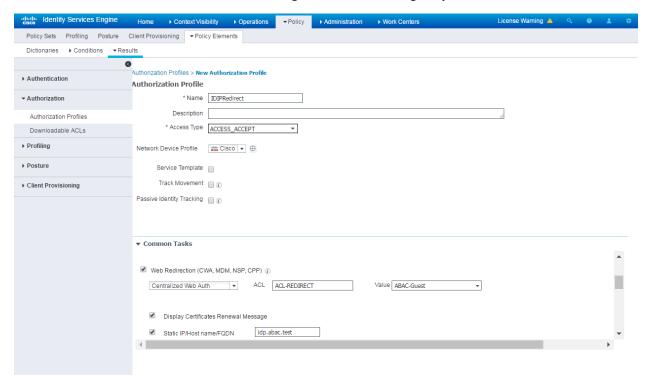

10. In the submenu, navigate to Results > Authorization > Authorization Profiles.

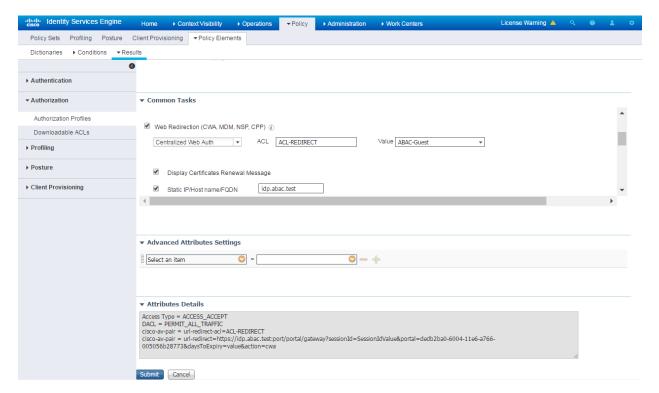

- 856
- 857 11. Click **Add.**
- 858 12. In the name field, enter "IDIPRedirect."
- 13. Set the access type to "ACCESS_ACCEPT."
- 860 14. Under Common Tasks, put a check next to Web Redirection (CWA, MDM, NSP, CPP).
- 15. In the revealed fields, choose **Centralized Web Auth.**
- 862 16. Set the ACL field to "ACL-REDIRECT."
- 17. Set the value such that it matches the created guest portal, "ABAC-Guest."
- 18. Put a check next to **Static IP/Host name/FQDN**.

19. Enter the hostname of the server on which Ping Federate is running, "idp.abac.test."

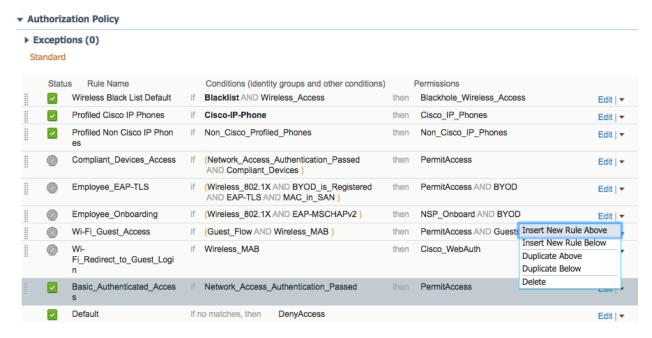

866

867 20. Click **Submit.**

- 869 2.6.7 Add Rule for Authorization Policy
- 1. Navigate to Policy > Policy Sets.
- 2. In the right sidebar, click on **Default.**
- 872 3. Under the Authorization Policy section, click the triangle next to edit.

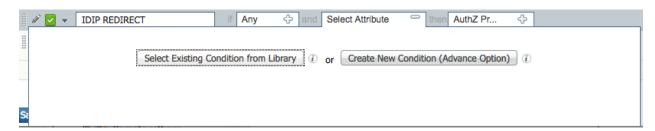

- 4. Provide a name for the rule, **IDIP REDIRECT.**
- 5. Click the **plus button** next to condition.

877

879 880

6. Choose, **Select Existing Condition from Library**.

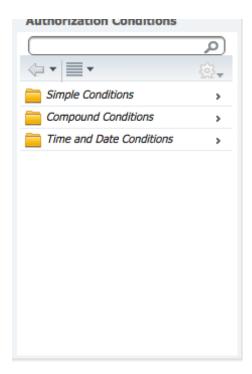

7. Click the **arrow** next to **Select Condition**

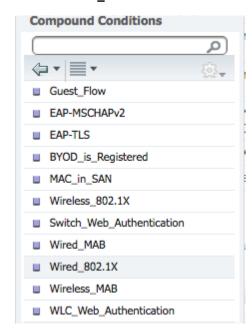

8. Choose Compound Conditions.

NIST SP 1800-3C: Attribute Based Access Control

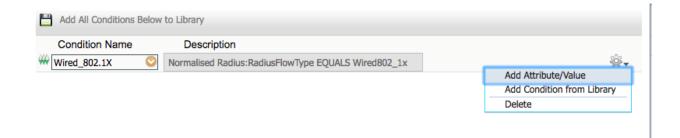

881

9. Choose wired_802.1x.

883

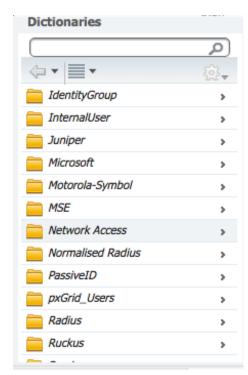

884 10. Click the cog icon.

886

11. Choose Add Attribute/Value.

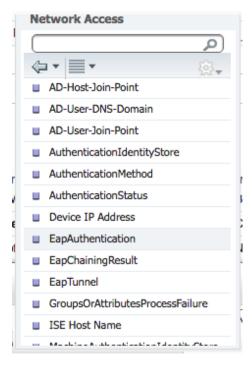

887 12. Select Network Access.

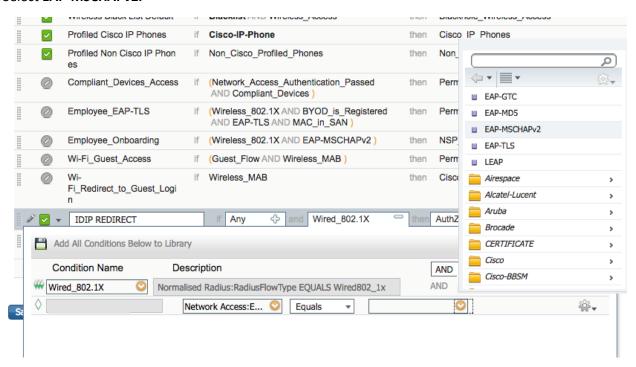

888

889

13. Select EapAuthentication.

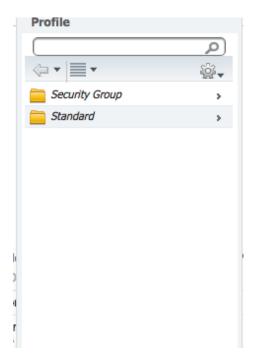

- 891 14. Click the **arrow** in the box next to Equals.
- 892 15. Select **EAP-MSCHAPv2**.

893

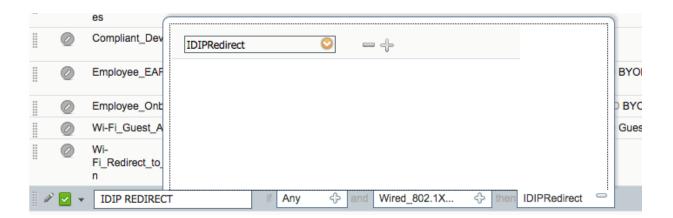

- 16. Click the **plus icon** in the **then** box.
- 895 17. Select Standard.

896

897 18. Select IDIPRedirect.

900 19. Click **Done.**

902 20. Click **Save.**

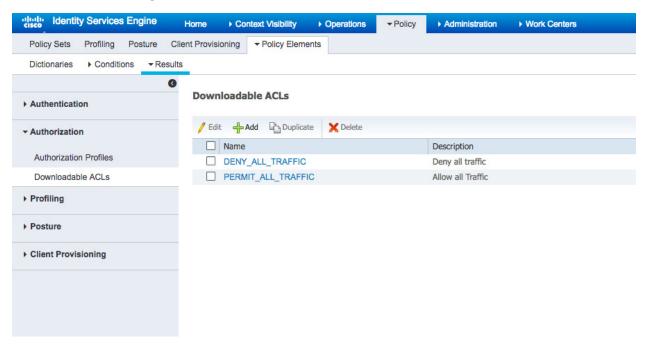

901

903

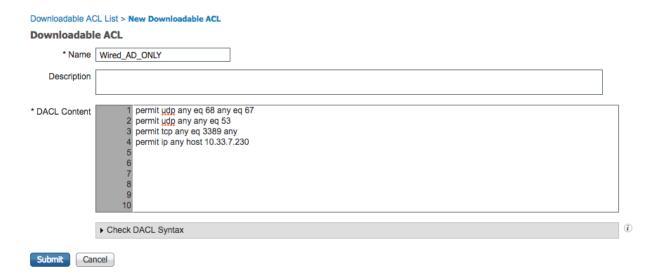

904

- **Machine Authorization Policy Rule**
- 905 21. Navigate to **Policy > Policy Elements > Results.**
- 906 22. In the left sidebar, navigate to **Authorization > Downloadable ACLs.**

- 908 23. Click Add.
- 909 24. For Name enter Wired_AD_ONLY.
- 910 25. For **DACL Content** match the entry below.

911

917

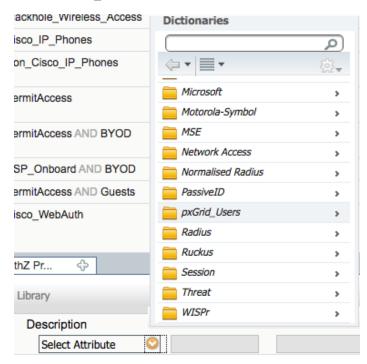

- 912 26. Click **Submit.**
- 913 27. Navigate back to Policy > Policy Sets.
- 914 28. Click on **Default** in the left sidebar.
- 915 29. Click the **triangle** next to the edit button on the IDIP REDIRECT line.
- 916 30. Click Insert New Rule Above.

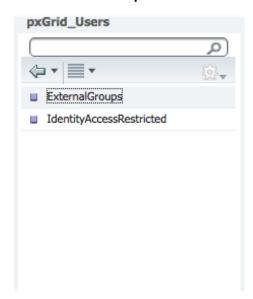

- 918 31. Enter **Wired Machine** for the name.
- 919 32. Click the **plus button** next to condition.
- 920 33. Choose Create New Condition.

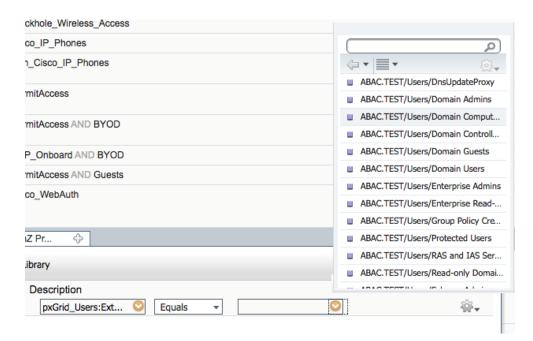

- 922 34. In the Select Attribute box, click the **arrow**.
- 923 35. Select PxGrid_Users.

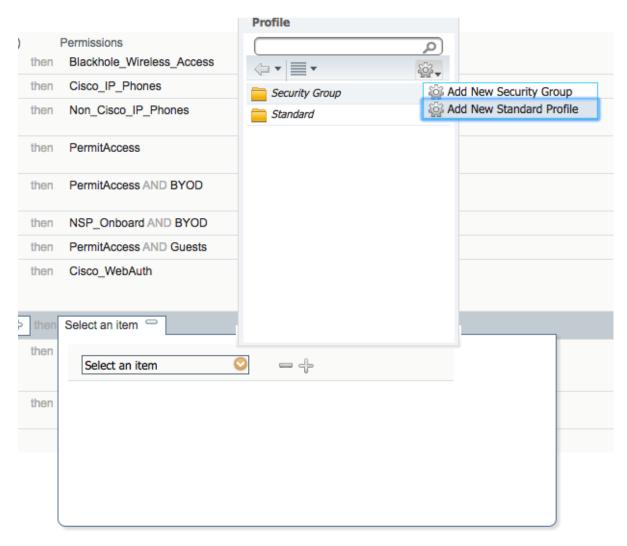

925 36. Select ExternalGroups.

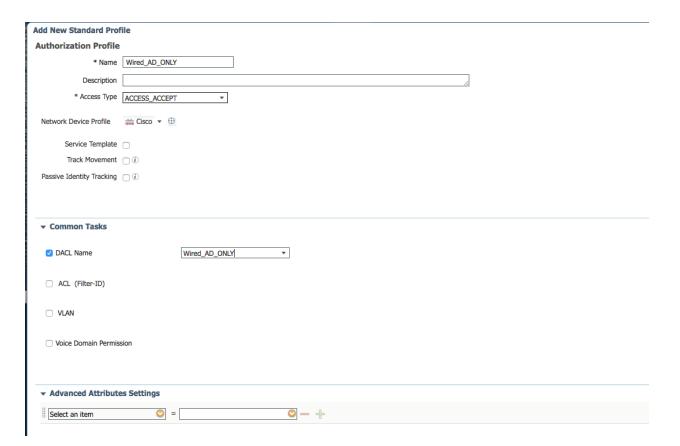

- 927 37. In the equals box, click the **arrow**.
- 928 38. Select ABAC.TEST/Users/Domain Computers.

- 930 39. In the Then box, click on the **plus icon.**
- 931 40. Click the **arrow** in the Select an Item box.
- 932 41. Click the **cog** in the top right of the pop-up window.
- 933 42. Select Add New Standard Profile.

- 935 43. Name the profile **Wired_AD_ONLY**.
- 936 44. In the Common Tasks section, check the box next to **DACL Name.**
- 937 45. Select **Wired_AD_ONLY** from the drop-down.

939 46. Click **Save.**

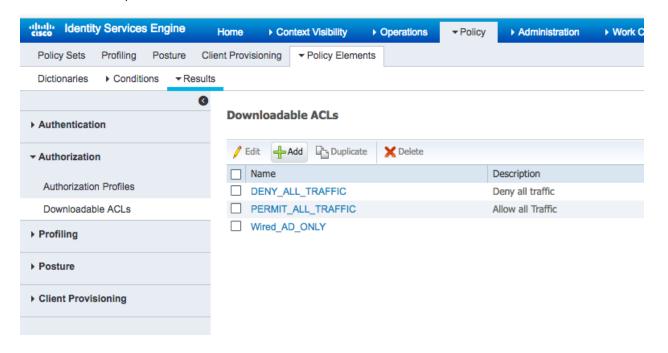

941 47. The completed rule should look similar to the one below.

User Authorization Policy Rule

- 48. Navigate back to **Policy > Policy Elements > Results.**
- 945 49. In the left sidebar, click on **Authorization > Downloadable ACLs.**

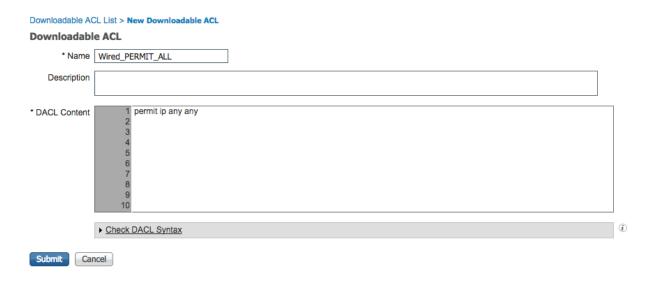

946

942

943

- 947 50. Click **Add.**
- 948 51. In the Name field, type Wired_PERMIT_ALL.
- 52. In the DACL Content field, type **permit ip any any**.

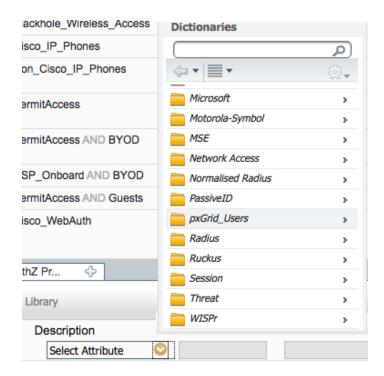

950

- 951 53. Click **Submit.**
- 952 54. Navigate back to **Policy > Policy Sets.**
- 953 55. Click on **Default** in the left sidebar.
- 954 56. Click the **triangle** next to the edit button on the IDIP REDIRECT line.
- 955 57. Click Insert New Rule Below.

956

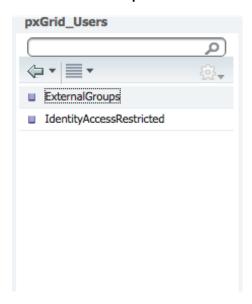

- 58. In the name field, type Wired User.
- 958 59. Click the **plus icon** in the condition box.
- 959 60. Select Create New Condition.
- 960 61. In the Select Attribute box, click the **arrow**.
- 961 62. Select PxGrid_Users.

962

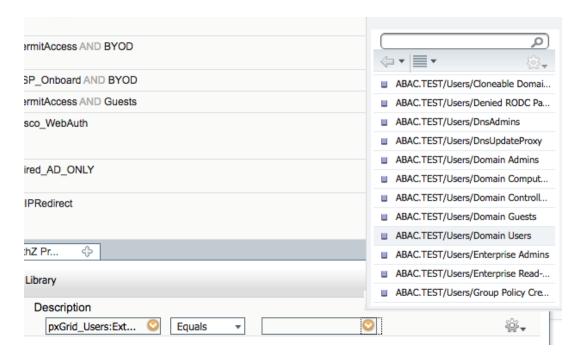

963

63. Select ExternalGroups.

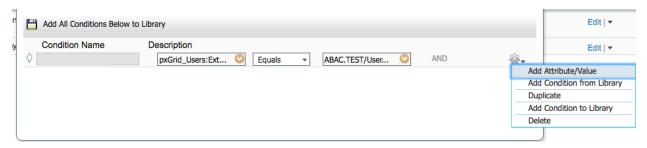

964

- 64. In the equals box, click the arrow.
- 966 65. Select ABAC.TEST/USERS/Domain Users.

967 968

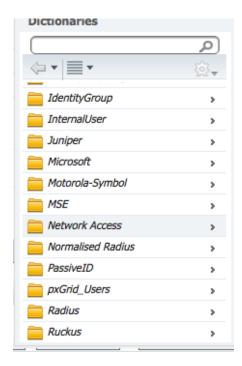

- 66. Click the cog.
- 969 67. Select Add Attribute/Value.

970

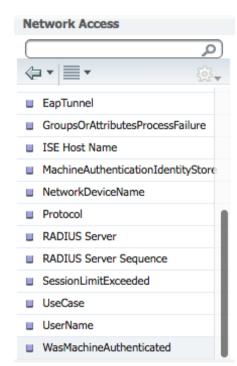

971

68. In the new attribute box, select **Network Access**.

972

973 69. Select WasMachineAuthenticated.

- 975 70. In the equals box, select **True.**
- 976 71. In the then box, click the **plus icon.**
- 977 72. Click Select an item.
- 978 73. Click the **cog.**

- 979 74. Select Add New Standard Profile
- 980 75. In the name field, put Wired_PERMIT_ALL.
- 981 76. In the Common Tasks section, check the box next to **DACL Name.**
- 982 77. In the box that appears, select **Wired_PERMIT_ALL.**
- 983 78. Click **Save.**

984 985

986

987

79. Back on the Policy page, click **Save** again. The final rule should look similar to the one below.

2.7 Install RSA AA

- 988 RSA AA (On-Premise) comes packaged as a virtual snapshot that must be installed on a virtual machine 989 (VM). A full installation requires core and back office applications, database scripts, and maintenance 990 tools – all necessary for this build. Follow these instructions to install RSA AA for the identity provider.
- 991 1. Log on to VMware and load the RSA AA virtual appliance (e.g., Adaptive Authentication [On-992 Premise] 7.0.0.0-SNAPSHOT).
- 993 2. Start the RSA AA VM using VMware.
- 3. Log on to the server that hosts the new VM.
- 995 4. Launch the RSA AA installation file.
- 996 5. On the Installation Types screen, select **Full** to install all required components. Then, click **Next**.

998

6. Click Next in the Installation Components screen.

999 1000

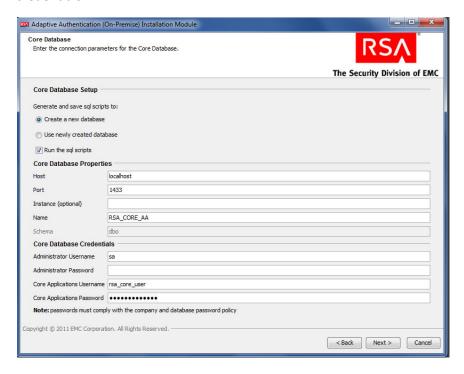

1001

7. In the environment screen, set the database type (MS SQL) and the JDBC driver file as shown in the following screenshot.

1004

8. For the core database setup, create a new database, and set the core database properties and credentials.

10051006

1007

9. On the Core Database screen, set parameters for the data and log files (directory, name, size, and growth).

10. On the Core Applications screen, select to install the image service, and provide the web service credentials and application server properties.

11. On the Site-to-User Authentication screen, select **Install site-to-user images**, which defines how the site authenticates users. **Select Save images in the Core Database** and select the directory shown in the following screenshot as the source directory. During enrollment, users are asked to select a personal image for authentication.

12. Review the configuration options on the Installation Parameters Summary and click **Install**. Once complete, you can confirm that the installation was successful by viewing the log files.

2.8 Configure RSA AA Rules

RSA has a built-in policy management application that allows administrators to create and update rules for user login based on various scenarios. For example, high-risk users can be required to answer challenge questions or respond to an out-of-band SMS. For more information, see the Back Office User's Guide. This example shows how to create a challenge rule for users to confirm identity for large transactions using an out-of-band SMS code. RSA Back Office allows administrators to manage setup policy for enabling the enhanced features provided by the RSA adapter, such as answering challenge questions and providing SMS confirmation codes enabled through this interface.

1034

1035

1036

1037

1038

1039

1040

1041

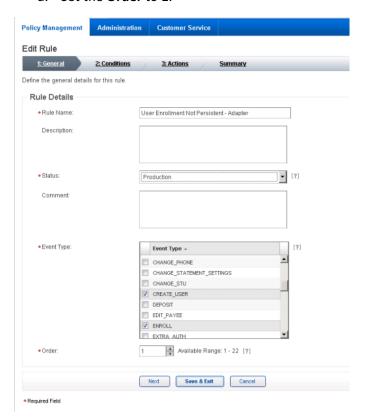

1028 2.8.1 Create Rule for Non-Persistent User Enrollment

RSA AA requires information for each user to help verify their identity. These users are classified into two groups: persistent and non-persistent users. A rule is created to request enrollment information for non-persistent users, those not kept in the user database.

- Log in to the Back Office application [http://xxx.xxx.xxx.xxx:8080/backoffice]
 - 2. Once logged in, click Manage Rules under Policy Management. Select New Rule.
- 3. In the Rule Details (in the General tab):
 - a. Set Rule Name to User Enrollment Not Persistent Adapter.
 - b. Set the Status to Production.

<u>Note</u>: The rule cannot be in production until it is created and approved by an administrator.

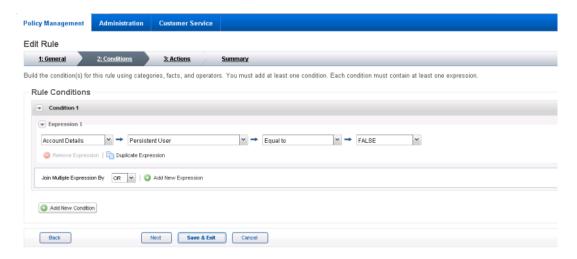

- c. In Event Type, select Create User and Enroll.
- d. Set the **Order** to **1**.

1042

1044

- 1043 4. Click **Next**.
 - In the Rule Conditions page, add a condition (Condition 1) and with one expression (Expression 1). Set Expression 1 to Account Details such that Persistent User is Equal to FALSE.

1049

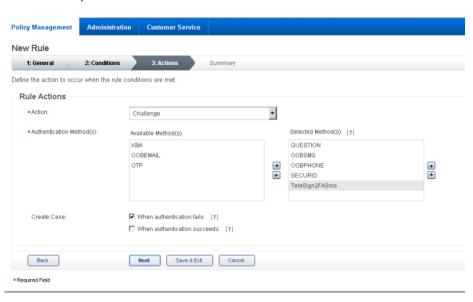

1050

1051

1052

1053

- 1047 6. Click **Next**.
- 1048 7. In the **Rule Actions** page:
 - a. Set Action to Challenge.
 - b. Set Authentication Methods to QUESTION, OOBSMS, OOBPHONE, SECURID, and TeleSign2FASms.
 - In Create Case, make sure that only for when authentication fails is selected.
 Then, click Next.

1054

1055

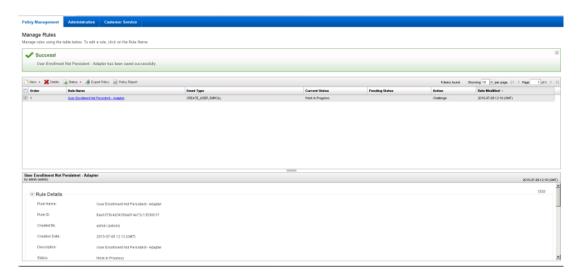

1056

1057

8. Review the rule settings in the **Summary** page. Then, click **Save and Finish**.

Once created, a rule is in Work in Progress status until approved by an administrator.

9. Click Status and Approve Status, then click Approve to set rule to Production status.

1059

You can use these steps to create each of the rules in the following sections.

1060 2.8.2 Create Rule for Persistent User Enrollment

1061 Persistent users are those that will be added to the user table.

1062 Table 2-1 Persistent User Enrollment

Rule Name	User Enrollment Persistent –Adapter
Event Type	Create User, Enroll
Rule Order	2
Rule Condition	IF (Account Details > Persistent User Equal to TRUE)
Rule Action	Allow
Authentication Method	
Create Case	No

1063

1064

2.8.3 Create Rule for User Updates

Once users are created, a rule is applied to allow persistent users to update their information.

1066 Table 2-2 User Update

Rule Name	User Update
Event Type	User Update
Rule Order	3
Rule Condition	IF (Account Details > Persistent User Equal to TRUE)
Rule Action	Allow
Authentication Method	
Create Case	No

1068 2.8.4 Create Rule for Challenge SMS

In this build, large transactions require users to respond to an out-of-band SMS challenge during
 authentication. When transactions meet the prerequisite, a random code will be sent to the user's SMS enabled device that must be entered to confirm the transaction.

1072 Table 2-3 Out-of-Band SMS

Rule Name	Challenge SMS for Payment
Event Type	Challenge
Rule Order	4
Rule Condition	IF (Transaction Details > Transaction Amount is BE- TWEEN 5000 and 10000)
Rule Action	Allow
Authentication Method	1. OOBSMS

10761077

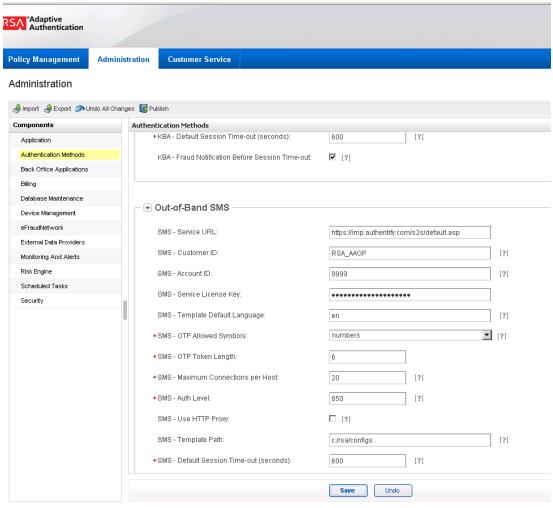

1078

1079

1074 2.8.5 Increase SMS Token Length

The default token length for out-of-band SMS is currently set to four digits. Access the Administration tab on the Back Office application. Under Components, select Authentication Methods and scroll down to the Out-of-Band SMS section. Adjust the token length by changing the value of SMS - OTP Token Length to six.

Figure 2-1 Out-of-Band Token Length

1085

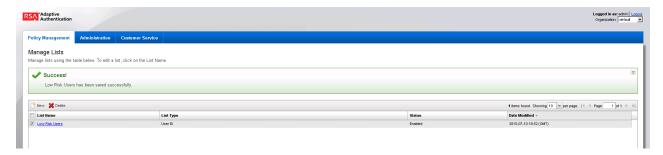

1086

2.8.6 Create Policy for Session Sign-In

The following rules create different sign-in scenarios for users based on an RSA-generated risk score at the time of login. RSA AA uses a risk engine to give users a risk score to determine a level of trust at the time of access. See the tables in <u>Section 2.8.8</u> for the session sign-in parameters for each risk level. Before the session sign-in rules are created, lists need to be created to group users together. This build will group users into four categories based on risk level (low, medium, high, and critical).

1087 2.8.7 Create Lists for Session Sign-In

- 1088 1. Log in to the Back Office application.
- 1089 2. Go to **Policy Management** and select **Manage Lists**.
- 3. Set List Name to Low Risk Users, List Type to User ID, and Status to Enabled.
- 4. Under List Content, select Add Value and set the Value to demolowrisk and Organization to default.
- 1093 5. Click Add Value.
- 1094 6. Click **Save**.
- Repeat these steps to create a list for Medium, High, and Critical risk users.
- 1096 Figure 2-2 Successful List Created

1097

1098

2.8.8 Create Rules for Session Sign-In

1099 Repeat the steps as in <u>Section 2.8.1</u> to create the session sign-in rules for different user groups.

1100 Table 2-4 Session Sign-In – Low Risk

Rule Name	Session Sign In – Low Risk
Event Type	Session Sign-in
Rule Order	5
Rule Condition	IF (Account Details>User ID within Low Risk Users)
Rule Action	Allow
Authentication Method	
Create Case	No

1101 Table 2-5 Session Sign-In – Medium Risk

Rule Name	Session Sign In – Medium Risk
Event Type	Session Sign-in
Rule Order	6
Rule Condition	IF (Account Details>User ID Within Medium Risk Users)

Rule Action	Allow
Authentication Method	1. Question
Create Case	When Authentication Fails

1102 Table 2-6 Session Sign-In – High Risk

Rule Name	Session Sign In – High Risk
Event Type	Session Sign-in
Rule Order	7
Rule Condition	IF (Account Details>User ID Within High Risk Users)
Rule Action	Challenge
Authentication Method	1. OOBSMS
	2. OOBPhone
Create Case	When Authentication Fails

1103 Table 2-7 Session Sign-In – Critical Risk

Rule Name	Session Sign In – Critical Risk
Event Type	Session Sign-in
Rule Order	8
Rule Condition	IF (Account Details>User ID Within Critical Risk Users)
Rule Action	Challenge
Authentication Method	1. Securid
Create Case	When Authentication Fails

1104 2.8.9 Create Rule to Allow Forced Sign-In for Payment

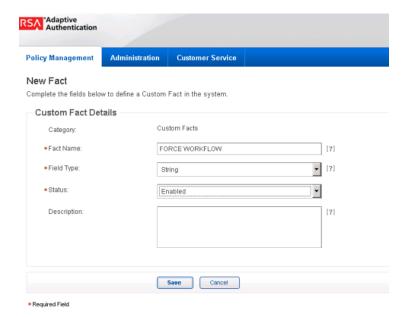

The rules for session sign-in in the preceding sections were based predefined facts built within RSA AA.

This build requires a rule that uses additional facts that are not within the build. Fortunately, new facts
can be created within the Back Office application. Once custom facts are created, they can be used to
build further rules.

1109 2.8.10 Create Custom Fact

1110

- 1. Log in to the Back Office application.
- 2. Go to Policy Management and select Manage Custom Facts.
- 3. Select **New** and set the **Field Name** to **Force Workflow**, **Field Type to String, and Status to**Enabled.

1114

1115 4. Click **Save**.

11161117

1118

5. Create a new rule using this custom fact that allows payment if this fact is met. Use the settings in the following table.

NIST SP 1800-3C: Attribute Based Access Control

1119 Table 2-8 Force Allow

Rule Name	Force Allow
Event Type	Payment, Session Sign-in
Rule Order	9
Rule Condition	IF (Custom Fact > Force Workflow Equal to Allow)
Rule Action	Allow
Authentication Method	
Create Case	No

1120 2.9 Install and Configure PingFederate-RP

The PingFederate installation in this section is for the Federation Server at the RP. This is the only component at the RP in this section. Even though the goal of this section is to set up the federation for the IdP, the basic configuration of the PingFederate-RP in this section is necessary to produce metadata that is exchanged with the IdP. A complete configuration of the PingFederate-RP will be performed in Section 3 of this guide.

- 1. Log on to the RP's server that will host the PingFederate service, and follow the instructions at the link below to install PingFederate and run it as a Windows service.
 - https://documentation.pingidentity.com/display/PF73/Installation
- Follow these steps to perform a basic configuration of the PingFederate-RP and export the metadata.
 - 3. Launch your browser and navigate to the PingFederate app URL: https://<DNS_NAME>:9999/pingfederate/app. Replace DNS_NAME with the fully qualified name of the RP's PingFederate server (e.g., https://rp.abac.test:9999/pingfederate/app).
 - 4. Log on to the PingFederate application using the credentials you configured in the previous installation section.

1128

1129

1130

1131

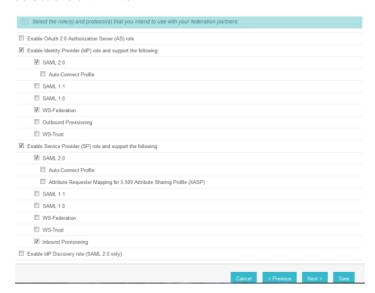

1132

1133

1134

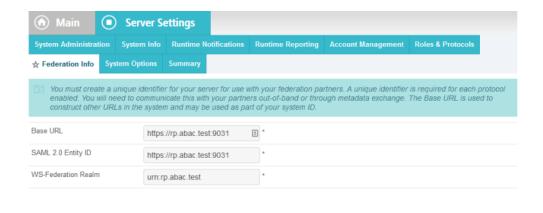

- 5. On the **Main Menu** under **System Settings**, click **Server Settings**.
- 1138 6. Click the Roles and Protocols tab.
- 7. Select Enable Identity Provider (IdP) role and support the following.

- 1140 8. Select SAML 2.0.
- 1141 9. Select WS-Federation.
- 1142 10. Select Enable Service Provider (SP) role and support the following.
- 1143 11. Select the SAML 2.0.

1144

- 12. Click Next.
- 13. On the Federation Info screen, enter the Base URL and SAML 2.0 Entity ID using the format https://<DNS_NAME>:9031 (e.g., https://rp.abac.test:9031).
- 14. Enter the WS-Federation Realm using the format urn:<DNS_NAME> 14. (e.g., urn:rp.abac.test).
- Note: Keep a copy of the urn, because it will be used later to configure the WS-Federation relationship with SharePoint.

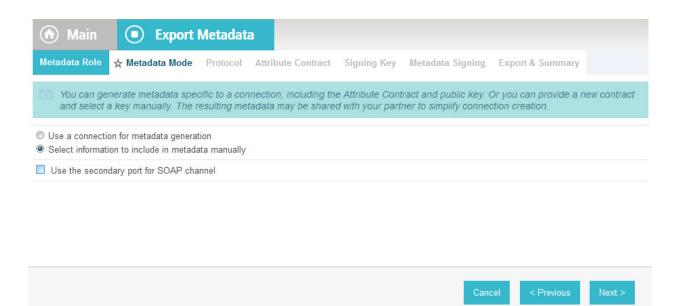

Cancel < Previous Next > Save

1152

- 1153 15. Click **Save**.
- 1154 16. On the Main Menu under Administrative Functions, click Metadata Export.
- 17. On the Metadata Role screen, select I am the Service Provider (SP).

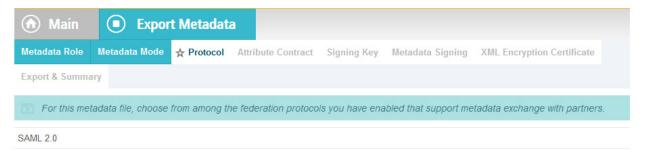

- 1157 18. Click **Next**.
- 19. On the Metadata Mode screen, select Select information to include in metadata manually.

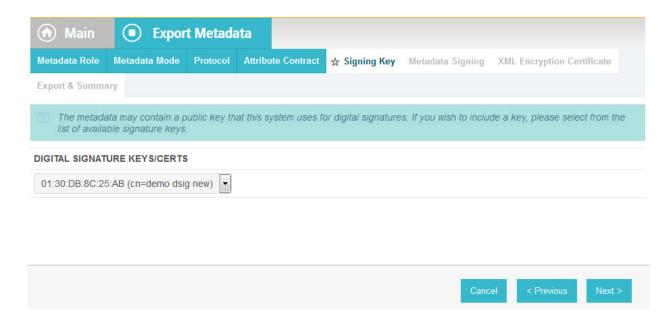

1159

- 1160 20. Click **Next**.
- 1161 21. On the Protocol screen, make sure that **SAML 2.0** is listed.

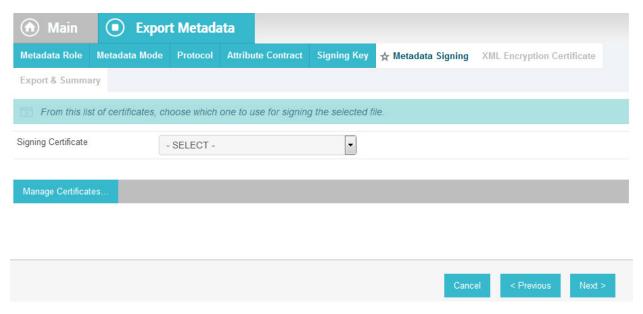

Cancel < Previous Next >

- 1163 22. Click **Next**.
- 23. On the Attribute Contract screen, click **Next**.
- 24. On the Signing Key screen, select the certificate that will be used to sign communications with the IdP.

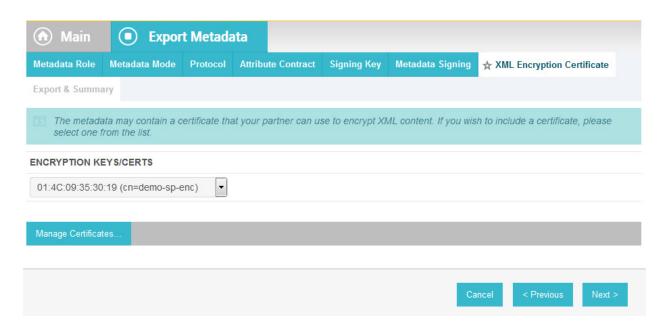

11671168

- Click Next.
- 26. On the Metadata Signing screen, if you plan to sign the metadata file that will be exported,select the certificate that will be used to sign the file.

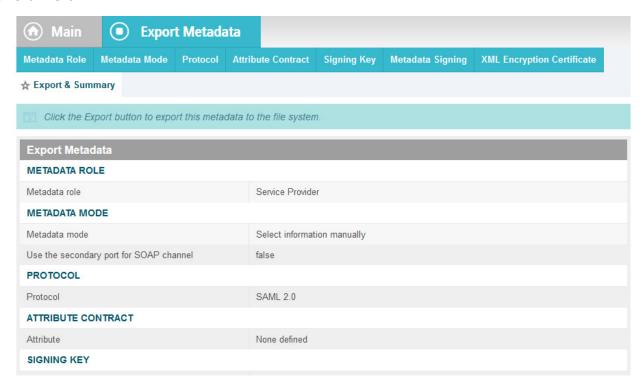

- 27. Click Next.
- 28. On the XML Encryption Certificate screen, select the certificate that the Identity Provider will use to encrypt XML messages.

1175

1176 29. Click **Next**.

1177

1178

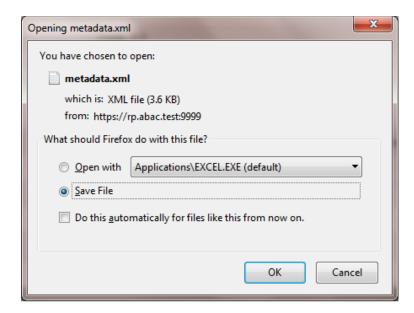

1179

1180

1181

30. Click Export.

This will create an export file that contains the metadata of the RP, which you can download using the browser. This file will be used later in the section, when configuring the PingFederate-IDP.

1183

1188

1198

2.10 Install PingFederate-IdP

- 1184 This PingFederate installation in this section is for the PingFederate-IdP.
- Log on to the server that will host the PingFederate service for the IdP, and follow the instructions at the
- link below to install PingFederate and run it as a Windows service.
- 1187 https://documentation.pingidentity.com/display/PF73/Installation

2.11 Install the SCE Plug-in for the PingFederate-IdP

- The SCE Plug-in integrates the features provided by RSA AA with PingFederate-IdP by providing a customizable user interface when RSA AA is accessed. New users will be enrolled into RSA's enhanced security features and be prompted to provide information such as security questions, a phone number, email address, and an SMS-enabled device. Follow the instructions below to install the SCE Plug-in adapter for the IdP. The variable <PF-install> used in the instructions corresponds to the PingFederate installation path. In this build, the PingFederate installation path was *c:\pingfederate-7.3.0*.
- 1. Log on to the server that hosts the PingFederate service for the Identity provider.
- Download the SCE Plug-in adapter jar file (e.g., sce-adapters-pingfederate-aa.1.1.jar) to
 the local PingFederate server.
 - 3. Copy the jar file to <PF-install>/server/default/deploy
- 4. From the adapter dist/conf/template folder, copy all .html files to
- 1200 <PF-install>/server/default/conf/template.
- 1201 5. From the adapter dist/conf/template/assets folder, copy the aa folder to
- 1202 <PF-install>/server/default/conf/template/assets
- 1203 6. From the adapter dist/data/adapter-config folder, copy the aa folder to

1204		<pf-install>/server/default/data/adapter-config</pf-install>
1205	7.	From the adapter dist/lib folder, copy all .jar files to
1206		<pf-install>/server/default/lib</pf-install>
1207	2.12	Install the Situational Context Connector for the PingFederate-IdP
1208 1209		tuational Context Connector and a Session Validator must be installed. In this build, both are ed on the PingFederate-IdP Server.
1210	2.12.	1 Install Situational Context Connector
1211	1.	Log on to the server that hosts the PingFederate service for the Identity provider.
1212 1213	2.	Download the Situational Context Connector integration zip file (e.g., Situational_Context_Connector_v21.zip) to the local PingFederate server.
1214	3.	Stop the PingFederate service if it is running.
1215 1216 1217	4.	Unzip the integration kit distribution file (Situational_Context_Connector_v21.zip) and copy the adapter file, pf.plugins.ise-idp-adapter.jar, from the /dist to the PingFederate "deploy" folder:
1218		<pf_install>\pingfederate\server\default\deploy</pf_install>
1219	5.	Create a new sub-directory under the PingFederate \deploy folder called "portal."
1220		<pf_install>\pingfederate\server\default\deploy\portal\</pf_install>
1221	6.	Create a new sub-directory under the new \portal\ directory called "gateway."
1222 1223	7.	<pf_install>\pingfederate\server\default\deploy\portal\gateway\ Copy the "index.jsp" from the Adapter .zip /dist folder to</pf_install>
1224		<pf_install>\pingfederate\server\default\deploy\portal\gateway\</pf_install>
1225 1226 1227	8.	Edit the sessionIdCookie.setDomain parameter in the index.jsp file to specify the cookie domain of your PingFederate server (Note: valid cookie domains must contain a minimum of two "dots." For example ".company.com."

```
response.addHeader("sessionId", request.getParameter("sessionId"));
Cookie sessionIdCookie = new Cookie("sessionId", request.getParameter("sessionId"));
sessionIdCookie.setSecure(true);
sessionIdCookie.setPath("/");
sessionIdCookie.setHttpOnly(true);
sessionIdCookie.setDomain(".abac.test");
response.addCookie(sessionIdCookie);

List<Cookie> cookies = Arrays.asList(request.getCookies());
String resumePath = new String();

for(Cookie cookie : cookies){
   if (cookie.getName().equalsIgnoreCase("ResumePath")) {
      resumePath = cookie.getValue();
   }
}
```

9. Start or restart the PingFederate server.

1230 2.12.2 Install Situational Session Validator

- On the same PingFederate-IdP server, unpack the contents of the
 situational_SessionValidator.zip file found in the Context Connector integration kit zip file
 (Situational_Context_Connector_v21.zip).
- Navigate to the folder where you unpacked the Situational Session Validator and locate the
 redirector.properties file.
- 1236 3. Edit the values in the redirector.properties file according to your environment.

```
redirectorHTTPPort=8080

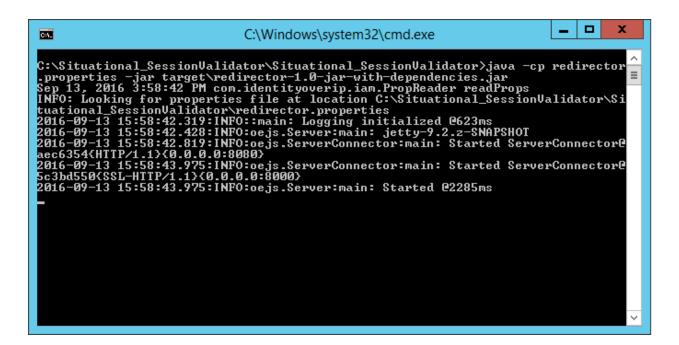

#redirectorSSLPort Number matches the Port configured in Cisco
ISE Guest Portal
redirectorSSLPort=8000

#redirectorDomain is the doamin for the PingFederate Server
redirectorDomain=abac.test
#pingFederateAddress is the resolvable URL for PingFederate
pingFederateAddress=https://10.33.7.4

#pingFederatePort is the port for the PingFederate Server
pingFederatePort=9031
```

12371238

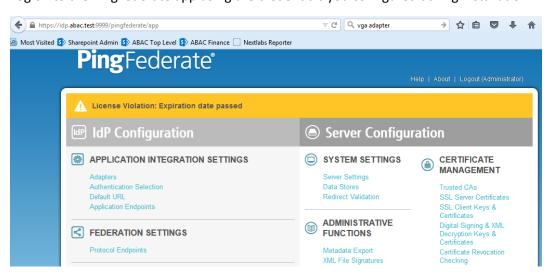

- <u>Note</u>: As shown above, the **redirectorSSLPort** should be the same port number that you chose for the Guest Access Portal settings during the ISE configuration. For this build it is set to **8000**.
- 4. Start the session validator by running the runme script, runme.bat. Afterward, you will see a Command Prompt window pop up running the script.

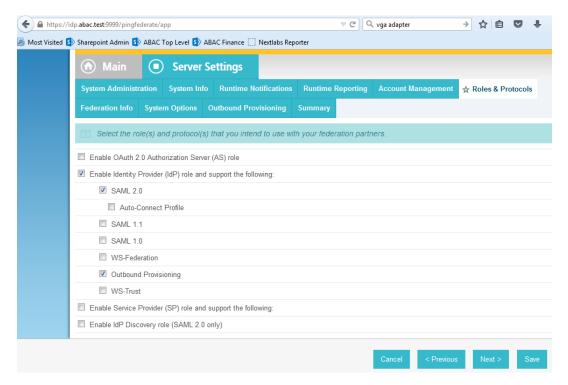

1243

2.13 Configure PingFederate-IdP

- Follow the instructions in the subsections below to configure PingFederate as the Federation Server for the IdP.
- 1246 1. Launch your browser and go to https://<DNS NAME>:9999/pingfederate/app.
- 2. Replace **DNS_NAME** with the fully qualified name of the IdP's PingFederate server (e.g., https://idp.abac.test:9999/pingfederate/app).
- 1249 3. Log on to the PingFederate app using the credentials you configured during installation.

- 1251 2.13.1 Configure SAML Protocol
- 1. On the Main Menu under System Settings, click **Server Settings**.
- Click the Roles and Protocols tab. Select Enable Identity Provider (IdP) role and support the
 following.
- 1255 3. Select **SAML 2.0**.

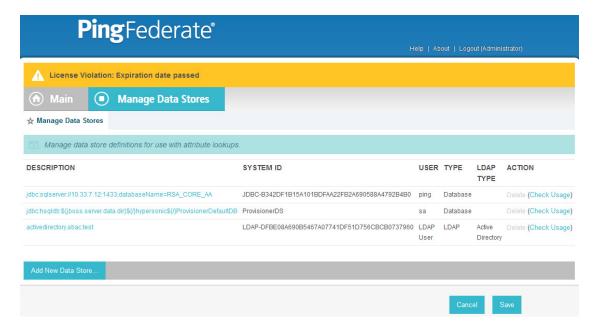

12581259

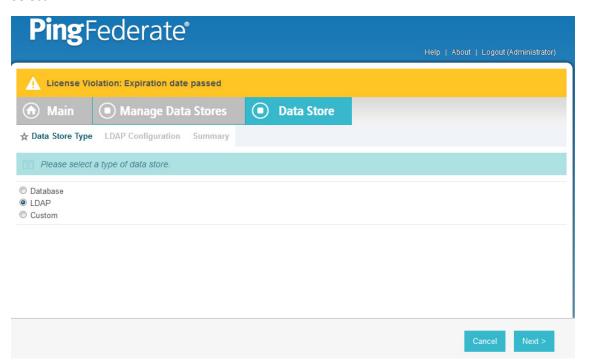

1257 4. Click **Save**.

2.13.2 Create Data Store for Microsoft AD

1. On the Main Menu under System Settings, click **Data Stores**.

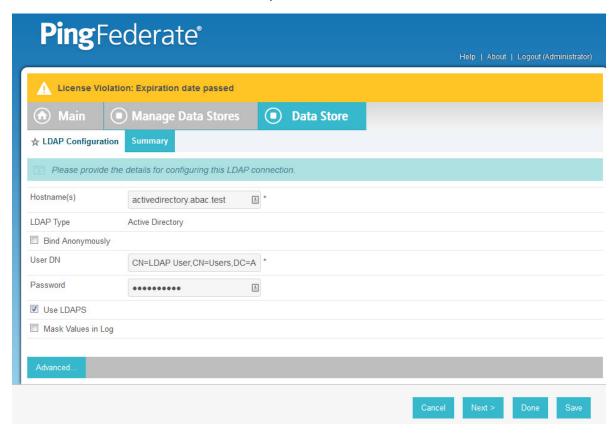

Select LDAP.

- Click Next.
- 4. Enter the Hostname where the Microsoft AD is hosted (e.g., activedirectory.abac.test).
- 5. For the **LDAP Type**, select **Active Directory**.
- 1266 6. Enter the **User DN** created in the earlier section named **Create the LDAP User for Federated**1267 **Authentication** (e.g., **CN=LDAP User, CN=Users,DC=ABAC,DC=Test**).
- 1268 7. Enter the password associated with the **LDAP User DN**. Select the option to use **LDAPS**.

1269 8. Click **Next**. Then, click **Save** on the Summary screen.

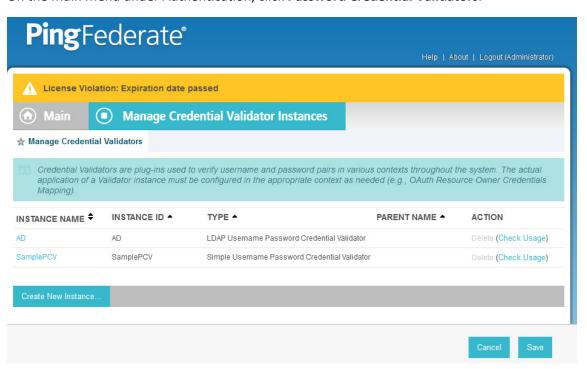

1270

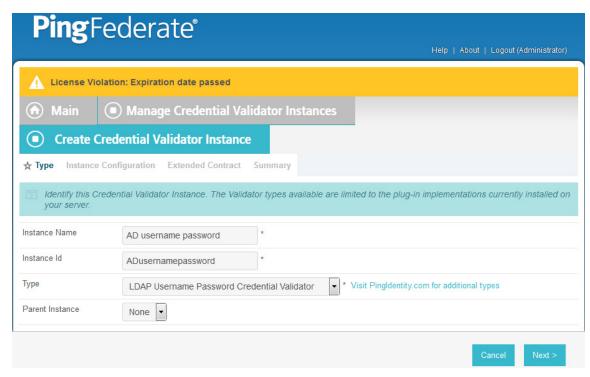

1272

1271 2.13.3 Create Credential Validator for Microsoft AD

1. On the Main Menu under Authentication, click Password Credential Validators.

- 1274 2. Click Create New Instance.
- 3. Enter a unique **Instance Name** you would like to use to refer to this configuration (e.g., **AD** username password).
- 4. Enter a unique **Instance Id** (typically the same as the Instance Name) without any spaces.
 - 5. For **Type**, select **LDAP Username Password Credential Validator**.

1280

1283

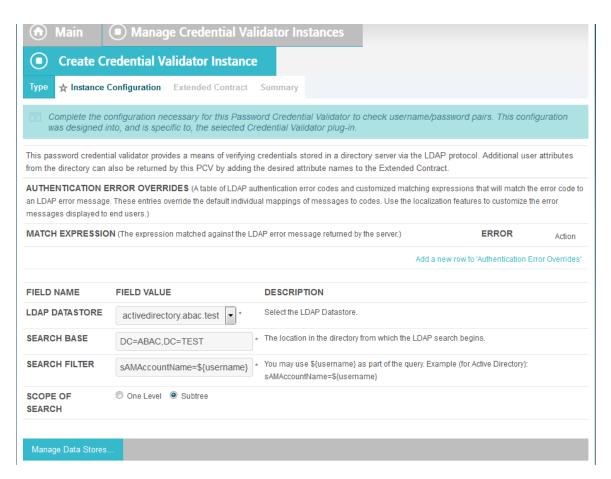

1284

1285

1286

1287

- Click Next.
- 7. For the **LDAP DATASTORE**, select the Active Directory data store you created earlier (e.g., activedirectory.abac.test).
 - 8. Enter the **SEARCH BASE** (location in the directory where the LDAP search begins) for your Microsoft AD LDAP directory (e.g., **DC=ABAC,DC=TEST**).
 - Enter the SEARCH FILTER (e.g., sAMAccountName=\${username}. The SEARCH FILTER allows Ping
 to search the LDAP directory, looking for a match where the attribute named sAMAccountName
 matches the username value passed from the Pingldentity server.

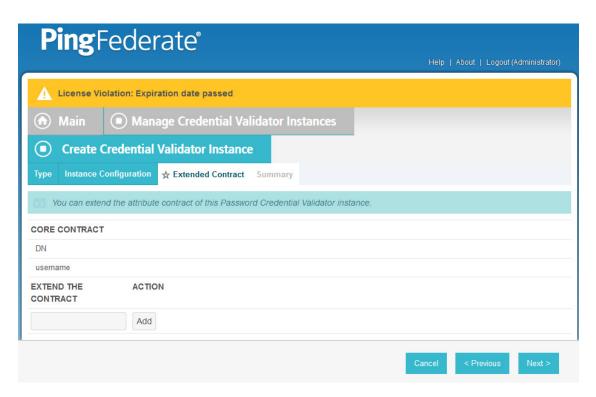

1288

1289

1290

10. Click Next.

You should see two attributes listed under **CORE CONTRACT**, **DN**, and **username**.

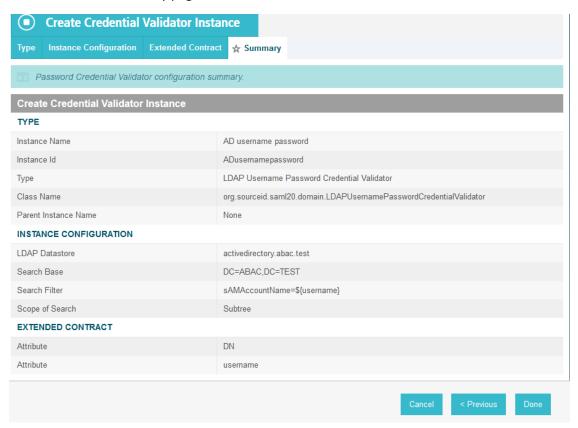

1292

1293

11. Click Next.

You should see a summary page.

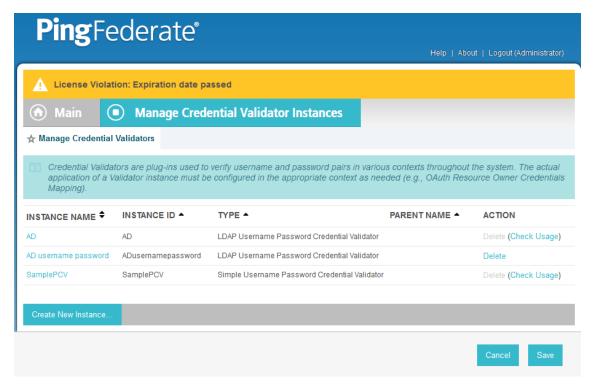

1295 12. Click **Done**.

1296

1297

You should see a list of the credential validator instances, including the newly added validator (e.g., **AD username password**).

1298

1299

1300

1301 1302

1303

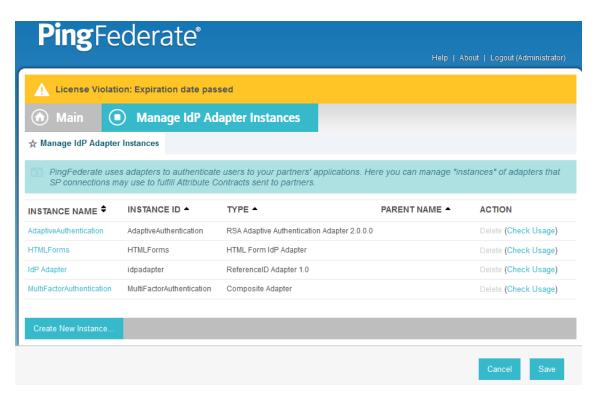

1304

13. Click Save to complete configuration of the credential validator.

2.13.4 Create IdP Adapter for Authentication with Microsoft AD via Web Browser Form

The IdP Adapter created in this section is the logical component PingFederate uses to authenticate a user with Microsoft AD via a web browser login page.

1. On the Main Menu under Application Integration Settings, click **Adapters**.

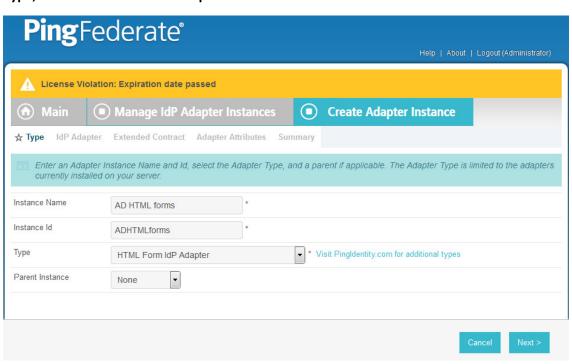

1306

1309

1310

- 2. Click Create New Instance.
- 3. In **Instance Name**, enter a unique name for the instance. The name will be used to refer to this configuration (e.g., **AD HTML forms**).
 - 4. Enter a unique **Instance Id** (typically the same as the instance name) without any spaces. For **Type**, select **HTML Form IdP Adapter**.

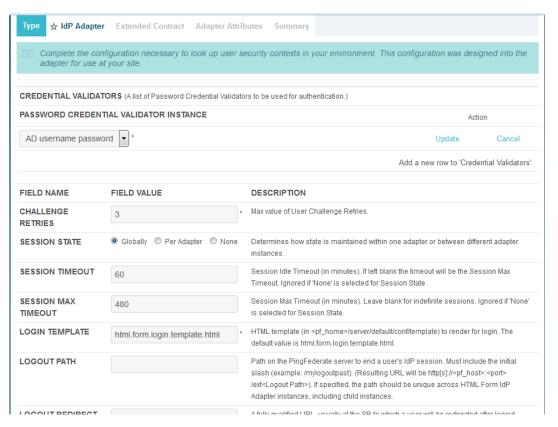

1312 5. Click **Next**.

1313

1314

1315

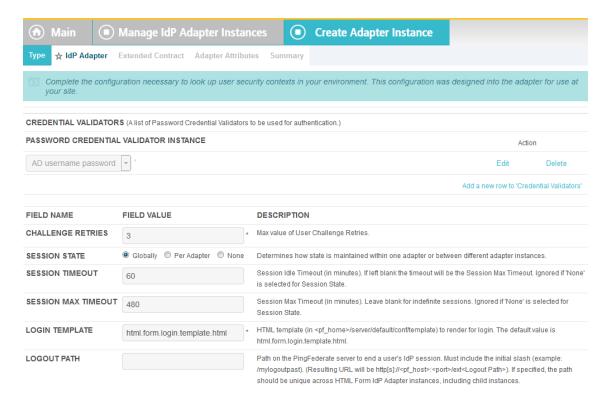

1316 1317 6. Under PASSWORD CREDENTIAL VALIDATOR INSTANCE, click on the Add a new row to Credential Validator's hyperlink. This will add a new selection box under the PASSWORD CREDENTIAL VALIDATOR INSTANCE with the value of "—Select One—" in it. In that new box, select the credential validator for Microsoft AD that was created in an earlier section (e.g., AD username password).

13181319

1320

7. Under **PASSWORD CREDENTIAL VALIDATOR INSTANCE**, click the **Update** hyperlink on the right side of the page. This will cause the selection box to turn grey.

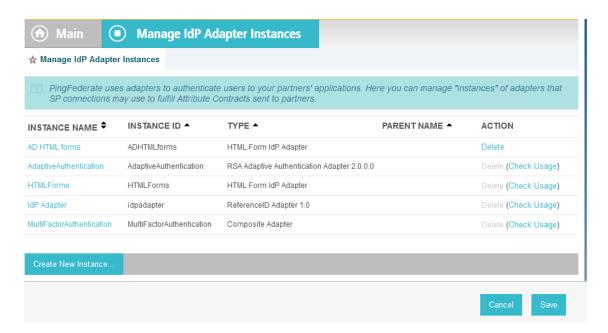

13211322

- 8. Click **Next**. Then, click **Next** again to bypass the Extended Contract screen.
- 9. On the Adapter Attributes screen, select the **PSEUDONYM** check box in the **username** row.

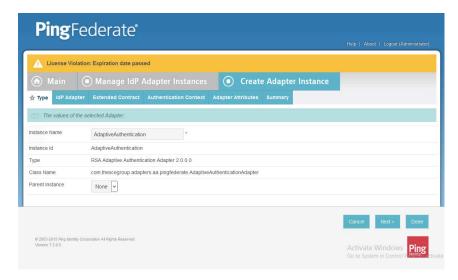

13241325

10. Click **Next**. On the Summary screen, click **Done**.

- 11. Click **Save** to complete configuration of the new adapter.
- 1328 2.13.5 Create IdP Adapter for Two-Factor Authentication with RSA AA
- The IdP Adapter created in this section is the logical component PingFederate uses to authenticate a user with RSA AA using a second factor.
- 1. On the Main Menu under Application Integration Settings, click **Adapters**.
- 2. On the Manage IdP Adapters screen, click **Create New Instance**.
- 3. On the Type screen, enter an Instance Name and Instance ID.
- 4. Set the following settings on the Adapter Type page before clicking **Next**:
- a. **Instance Name**: (Instance Name)
- b. Instance ID: (Instance ID)
- 1337 c. Type: RSA Adaptive Authentication Adapter 2.0
- d. Class Name:
- 1339 com.thescegroup.adapters.aa.pingfederate.AdaptiveAuthenticationAdapter
- 1340 e. Parent Instance: None

1344

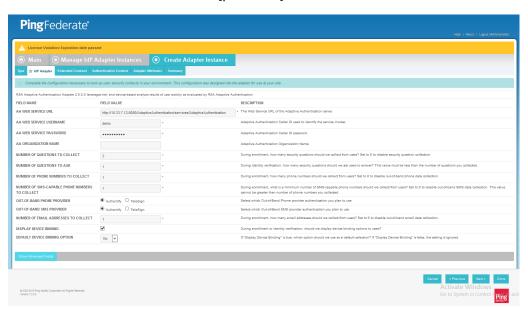

1345

1346

1347

- 5. On the IdP Adapter configuration page, click **Show Advanced Fields** and input the following parameters while leaving the rest as default, before clicking **Next**:
 - a. AA Web Service URL: http://<RSA Server

 DNS>:8080/AdaptiveAuthentication/services/AdaptiveAuthentication
 - b. AA Web Service Username: [username] (Credentials must match on RSA server.)
 - c. AA Web Service Password: [password]

13481349

1350

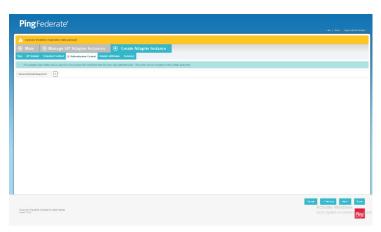

6. On the Extended Contract screen, type **transactionid** (all lowercase). Then, click **Add**. By default, username should already be listed under **Core Contract**.

1353

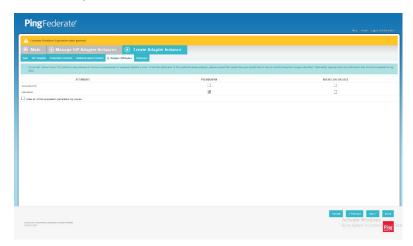

1354

- 7. Click Next.
- 8. On the **Authentication Context** screen, select *SecureRemotePassword* as the fixed value for authentication. This value will be included in the SAML assertion. Click **Next**.

13551356

9. On the **Adapter Attributes** screen, select *username* as the **Pseudonym**. Click **Next**.

- 10. On the **Summary** screen, verify that the information is correct and click **Done**.
- 1359 11. On the **Manager IdP Adapter Instances** screen, click **Save** to complete the Adapter configuration.

13631364

1365

1366

1367

1369 1370

1371

1361 2.13.6 Create Composite IdP Adapter Integrating Microsoft AD and RSA AA

The IdP Adapter created in this section is a composite adapter that integrates the two previously created adapters for Microsoft AD and RSA AA. When a user is directed to the PingFederate IdP server, the user will see a web form where they can enter their Microsoft AD credentials. Following authentication with Microsoft AD, PingFederate will initiate the second factor authentication with an SCE Plug-in. The SCE Plug-in will then present the user with a request for the second factor.

- 1. On the Main menu under Application Integration Settings, click Adapters.
- 1368 2. On the Manage IdP Adapters screen, click **Create New Instance**.
 - 3. Enter a unique **Instance Name** you would like to use to refer to this configuration (e.g., **RSA Multifactor**).
 - 4. Enter a unique **Instance Id** (typically the same as the **Instance Name**) without any spaces.
- 5. For **Type**, select **Composite Adapter**.

1373

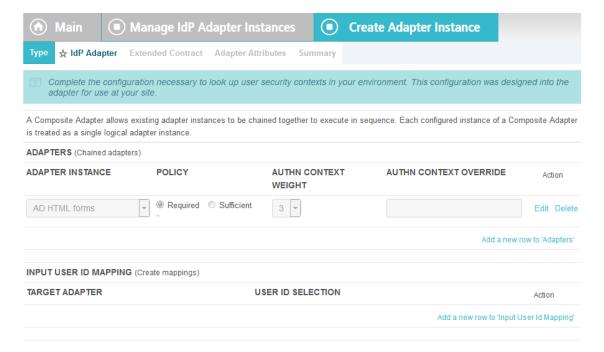

1374

1375

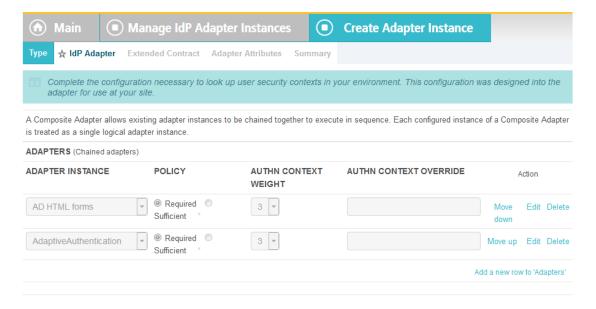

1376

13771378

- Click Next.
 - 7. On the IdP Adapter screen, under **ADAPTER INSTANCE**, click on the **Add a new row to**'Adapters's hyperlink. This will add a new selection box under the **ADAPTER INSTANCE** with the value of "—Select One—" into the box. In that new box, select the adapter instance for HTML forms with Microsoft AD that was created in an earlier section (e.g., AD HTML forms).
 - 8. Under **ADAPTER INSTANCE**, click the **Update** hyperlink on the right side of the page. This will cause the selection box to turn grey.

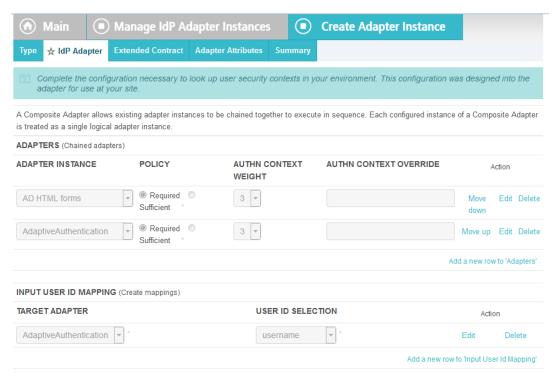

Repeat the previous steps to add another row to Adapters using the hyperlink on the right side
of the page. This time, select the AdaptiveAuthentication adapter in the selection box. When
complete, the IdP Adapter screen will look similar to the screenshot below, with two adapters
configured under ADAPTER INSTANCE.

- 10. Under TARGET ADAPTER, click on the Add a new row to 'Input User Id Mapping' hyperlink. This will add a new selection box under the TARGET ADAPTER with the value of "—Select One—" in the box.
- 11. In that new box, select the adapter instance for the RSA authentication that was created in an earlier section (e.g., **AdaptiveAuthentication**).

- 1392 12. In the new **USER ID SELECTION** box, select **username**.
 - 13. Under **TARGET ADAPTER**, click the **Update** hyperlink on the right side of the page. This will cause the selection box to turn grey.

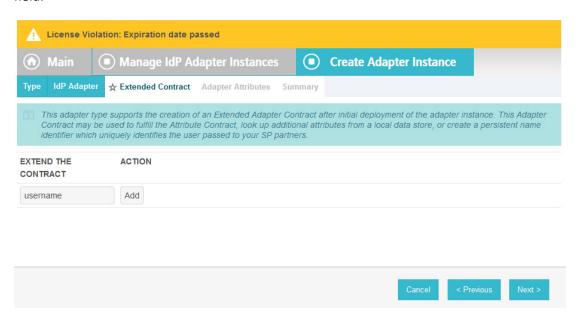

1396

1397 1398

1393

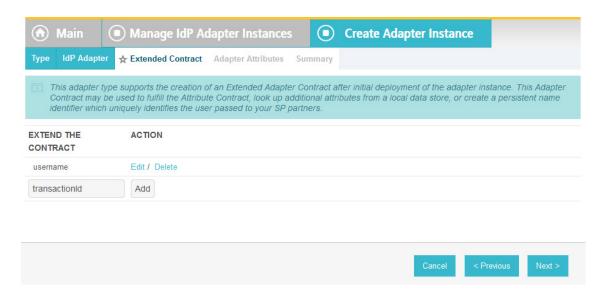

1394

- 14. Click Next.
 - 15. On the Extended Contract screen, enter the value **username** in the **EXTEND THE CONTRACT** field.

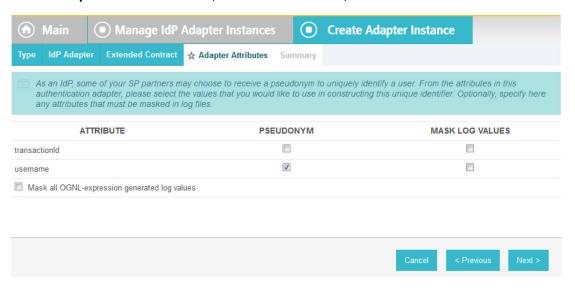

1399

1400 16. Click Add. Enter the value transactionid (all lowercase) in the EXTEND THE CONTRACT field.

- 17. Click **Add**. Then, click **Next**.
- 1403 18. On the **Adapter Attributes** screen, in the **username** row, select the **PSEUDONYM** column.

1404

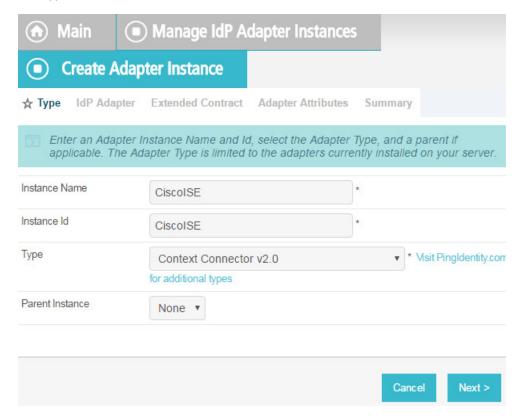

1412

- 1405 19. Click **Next**. On the **Summary** screen, click **Done**.
- 20. Click **Save** to complete configuration of the new composite adapter.
- 1407 2.13.7 Create IdP Adapter for the Situational Context Connector and ISE
 1408 Authentication

The IdP Adapter created in this section is the logical component PingFederate uses to obtain connection
 (device and network) information obtained from ISE Authentication via the Situational Context
 Connector. These device and network attributes serve as environmental attributes in this build.

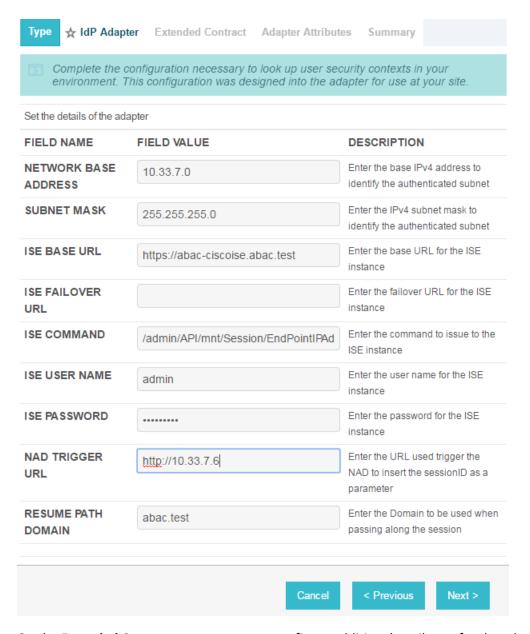

- 1. On the Main menu under Application Integration Settings, click Adapters.
- 1413 2. On the Manage IdP Adapters screen, click Create New Instance.

- 3. On the **Type** screen, enter an **Instance Name** and **Instance ID**.
- 1415 4. For Type, select **Context Connector v2.0**, and click **Next**.

1416

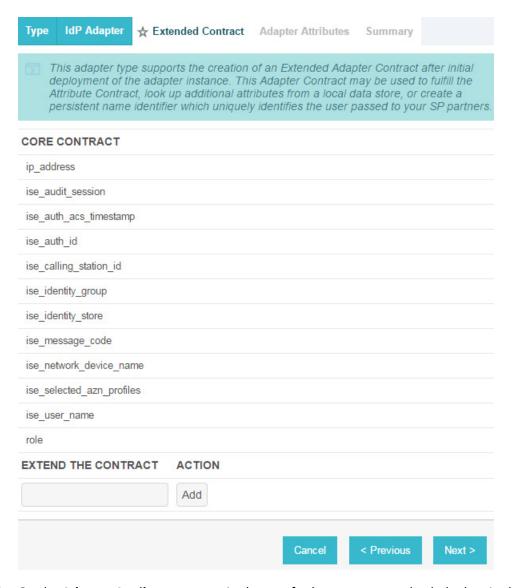

1417 5. Enter configuration information and click **Next**.

1419

1420

6. On the **Extended Contract** screen, you can configure additional attributes for the adapter. We retained the defaults and clicked **Next**.

142214231424

7. On the **Adapter Attributes** screen, in the row for **ise_username**, check the box in the **Pseudonym** column. Click **Next**. (Note: if you added other attributes in Step #6, you could check the box under **Pseudonym** for those as well.)

1426

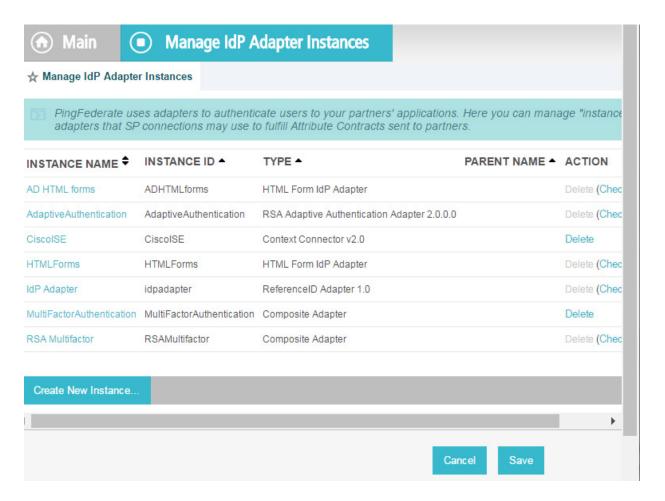

8. On the **Summary** screen, review the configuration and scroll down to click **Done**.

2.13.8 Configure the Federation Connection to the Relying Party

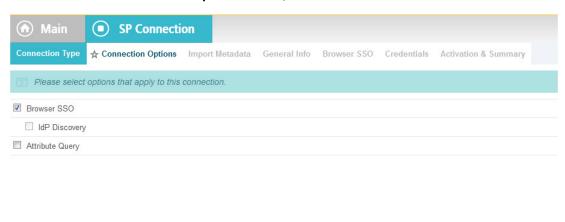

This PingFederate SP Connection at the PingFederate-IdP will configure the SAML exchange with a server in the RP's environment. This connection will also enable a user to authenticate using the composite adapter created in the previous section.

- 1. On the Main Menu under SP CONNECTIONS, click Create New.
- 1435 2. On the Connection Type screen, make sure **Browser SSO Profiles** is selected.

14361437

3. Click **Next**. On the **Connection Options** screen, make sure **Browser SSO** is selected.

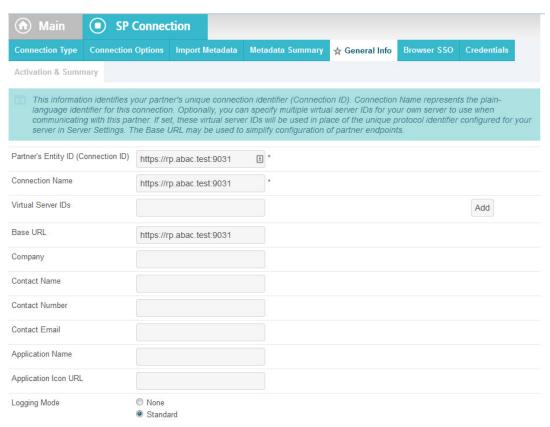

1438

- Click Next.
- 5. On the **Import Metadata** screen, click **Browse** and select the metadata file that you exported from the RP's PingFederate server.

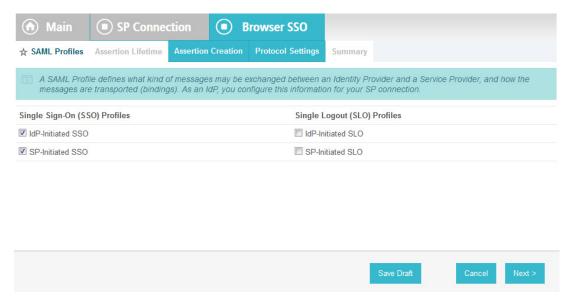

- 1442
- 1443 6. Click **Next**.
- 7. On the **Metadata Summary** screen, click **Next**.
- 8. On the **General Info** screen, you should see some configuration information (e.g., **Base URL**) about the RP that was taken from the metadata file that you selected earlier.

14471448

9. Click Next. On the Browser SSO screen, click Configure Browser SSO.

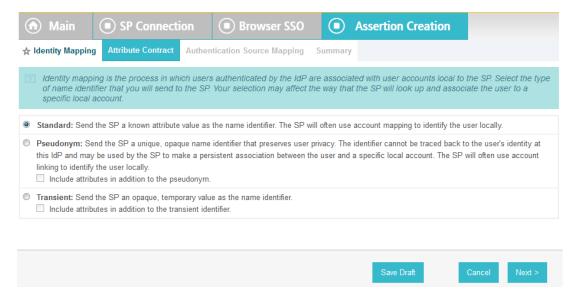

10. Select IdP-Initiated SSO and SP-Initiated SSO. Then, click Next.

1450

1455

- 1451 11. On the **Assertion Lifetime** screen, click **Next**.
- 12. On the **Assertion Creation** screen, click **Configure Assertion Creation**. This will bring up a sequence of sub-screens, starting with the **Identity Mapping** screen.
- 13. On the **Identity Mapping** screen, select the **Standard** option.

1456 14. Click **Next**. This will bring up the **Attribute Contract** screen.

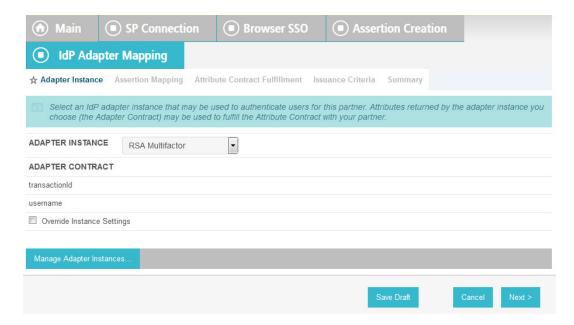

1457

1458 15. Click **Next**.

14591460

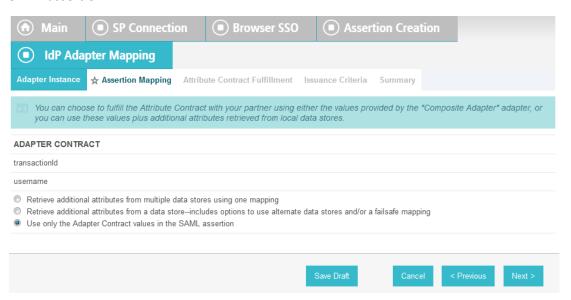

- 16. On the **Authentication Source Mapping** screen, click **Map New Adapter Instance**. This will launch a sequence of sub-screens, beginning with the **Adapter Instance** screen.
- 17. On the **Adapter Instance** screen, select the composite adapter created in an earlier section (e.g., **RSA Multifactor**).

1465

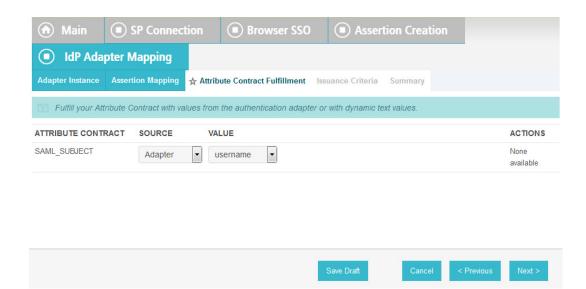

1466

18. Click **Next**. On the Assertion Mapping screen, select **Use only the Adapter Contract values in the SAML assertion**.

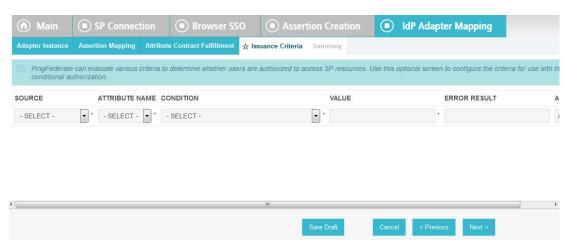

1467

- 19. Click Next.
- 20. On the Attribute Contract Fulfillment screen, for SAML_SUBJECT, select Adapter for the
 SOURCE field and username for the VALUE field.

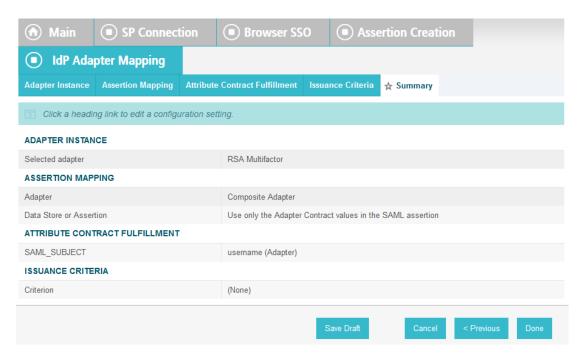

1471

1472 21. Click **Next**.

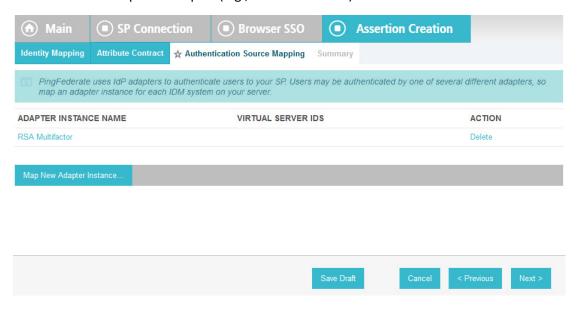

1473

1474 22. Click **Next**.

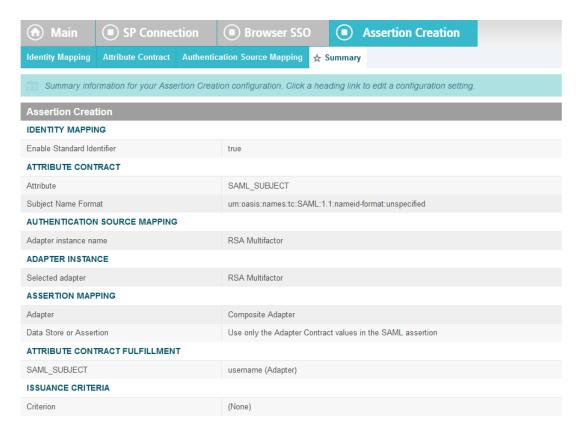

14761477

23. Click **Done**. This will bring you back to the **Authentication Source Mapping** screen, and you should see the composite adapter (e.g., **RSA Multifactor**) listed.

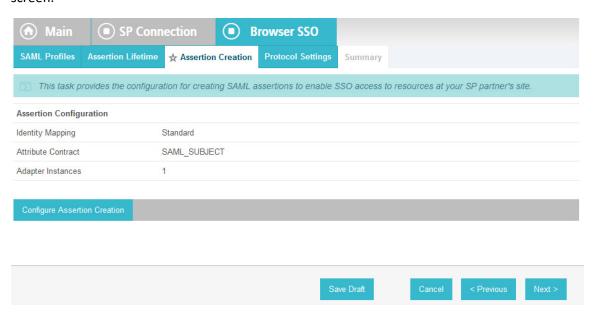

1478

1479 24. Click **Next**.

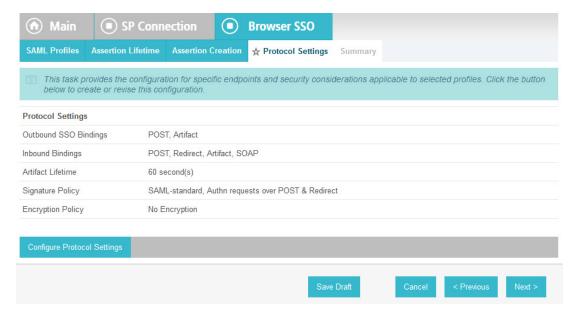

1482

25. On the **Summary** screen, click **Done**. This will take you back to the **Configure Assertion Creation** screen.

1483

1484 26. Click **Next**.

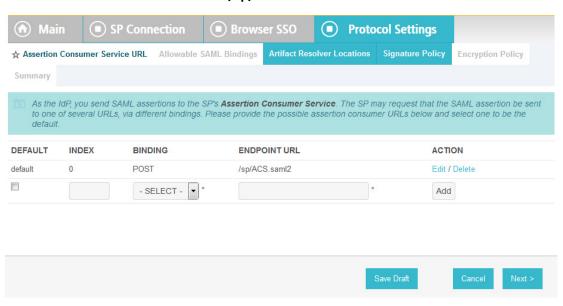

1486

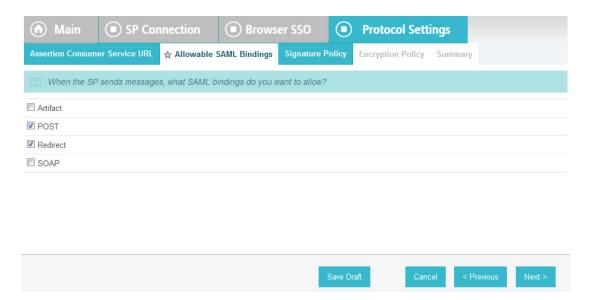

1487

1488 1489

- 27. On the **Protocol Settings** screen, click **Configure Protocol Settings**. This will launch a sequence of sub-screens, beginning with the **Assertion Consumer Service URL** screen.
- 28. On the **Assertion Consumer Service URL** screen, make sure that the **BINDING** field is set to **POST** and the **ENDPOINT URL** field is set to **/sp/ACS.saml2**.

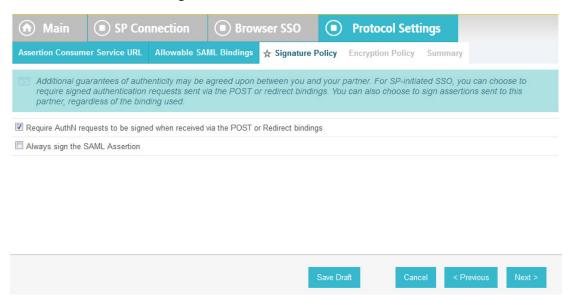

- 29. Click Next.
- 1492 30. On the Allowable SAML Bindings screen, select POST and Redirect.

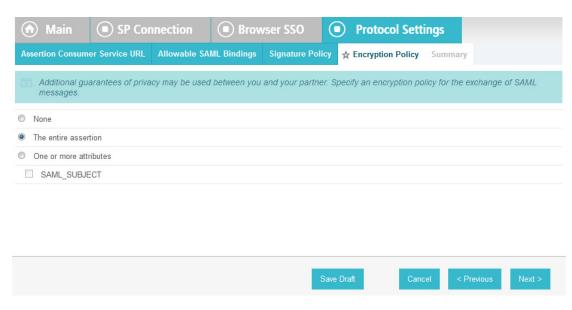

14931494

- 31. Click Next.
- 32. On the Signature Policy screen, select Require AuthN requests to be signed when received via
 the POST or Redirect bindings.

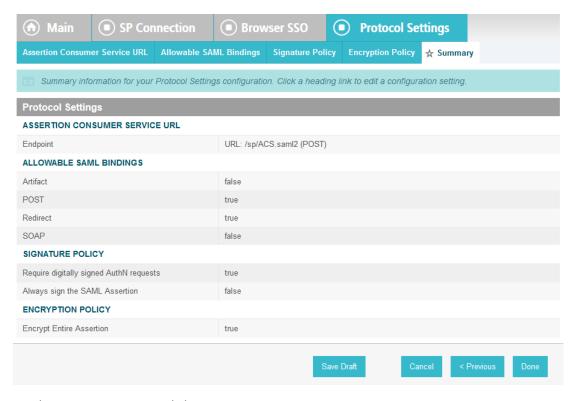

14971498

33. Click **Next**. On the **Encryption Policy** screen, select **The entire assertion**.

1499

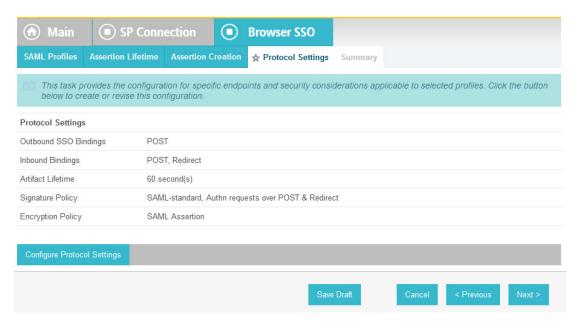

1500 34. Click **Next**.

1501

1502

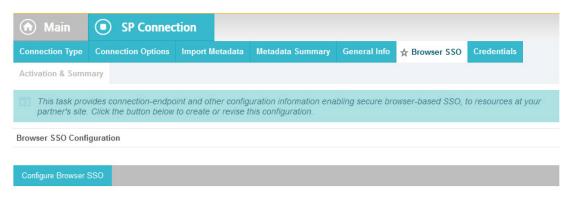

35. On the **Summary** screen, click **Done**.

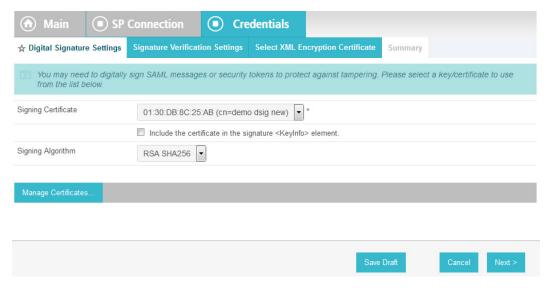

15031504

This will take you back to the **Protocol Settings** screen.

- 1505 36. Click **Next**.
- 1506 37. On the **Summary** screen, click **Done**.
- This will take you back to the **Browser SSO** screen.

- 38. Click Next.
- 39. On the **Credentials** screen, click **Configure Credentials**.
- 40. For the **Signing Certificate** field, select the certificate to be used to sign the SAML message.
- 1512 41. Select the certificate that you configured for the server in an earlier section.
- 1513 42. Select the **Signing Algorithm** for your environment (e.g., **RSA SHA256**).

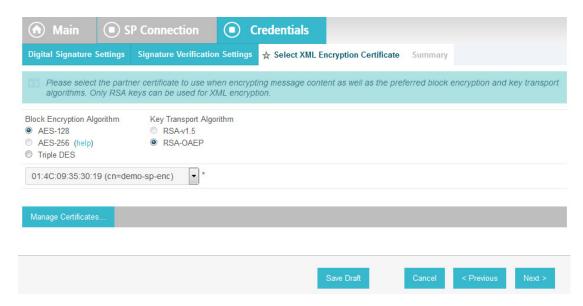

1515 43. Click **Next**.

1514

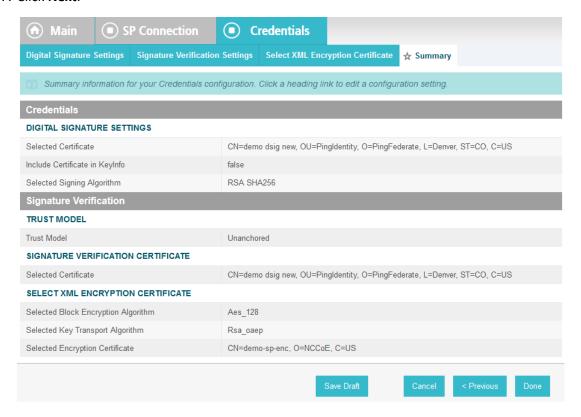

- 1517 44. Click **Next**.
- 45. On the **Select XML Encryption Certificate** screen, select the **Block Encryption Algorithm** (e.g., **AES-128**), and the **Key Transport Algorithm** (e.g., **RSA-OAEP**).
- 46. For the selection box above the **Manage Certificates** button, select the RP's public key certificate to be used to encrypt the message content.

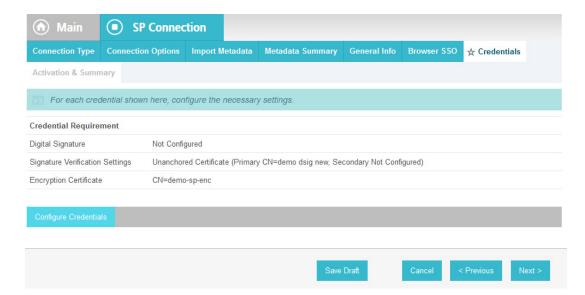

1523

47. Click Next.

15241525

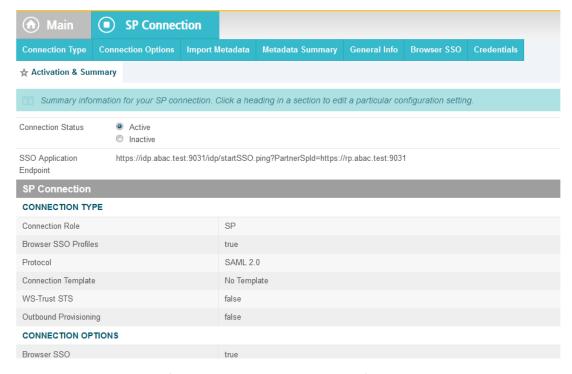

48. On the **Summary** screen, click **Done**. This will take you back to the **Credentials** screen.

15261527

1528

- 49. Click Next.
 - 50. On the Activation & Summary screen, select Active for the Connection Status field.

1529

1533

- 51. Copy the Identity Provider's SSO Application Endpoint URL (e.g.,
- https://idp.abac.test:9031/idp/startSSO.ping?PartnerSpId=https://rp.abac.test:9031) to the clipboard and save it to a text file, because this URL will be used in the Functional Test section.
 - 52. Click **Done**. This will take you to a screen that lists the connections for the server, including the new connection you just created. Click **Save** to complete the configuration.

- 1535 2.13.9 Configure ISE Composite Adapter
- 1536 1. From the Main page, click on **Adapters.**
- 1537 2. Click Create New Instance.

Main Manage IdP Adapter	Instances
★ Manage IdP Adapter Instances	
PingFederate uses adapters to authenticate users to your partners' applications. Here you	
INSTANCE NAME ♥	INSTANCE ID •
AD HTML forms	ADHTMLforms

ISE-RSA Composite Adapter	ISERSACompositeAdapter
MultiFactorAuthentication	MultiFactorAuthentication
RSA Multifactor	RSAMultifactor

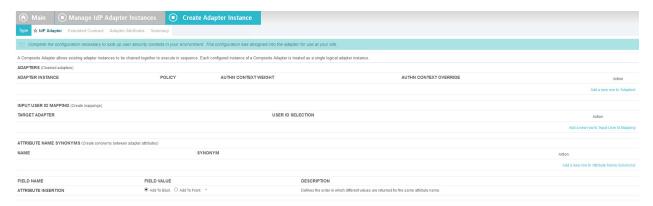

Create New Instance...

1538

- 3. In the Instance Name field, enter ISE-RSA Composite Adapter.
- 4. In the Instance ID field, give the same name without spaces.
- 5. In the Type field, choose **Composite Adapter**.

- Click Next.
- 1544 7. Click Add a new row to 'Adapters'.

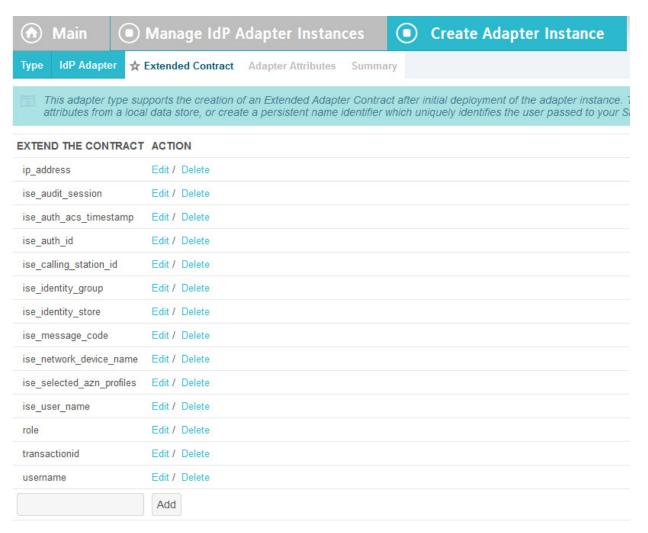

1545

- 1546 8. Choose **CiscolSE**.
- 1547 9. Click **Update**.
- 1548 10. Click Add a new row to 'Adapters'.
- 1549 11. Choose **RSA Multifactor**.
- 1550 12. Click **Update**.

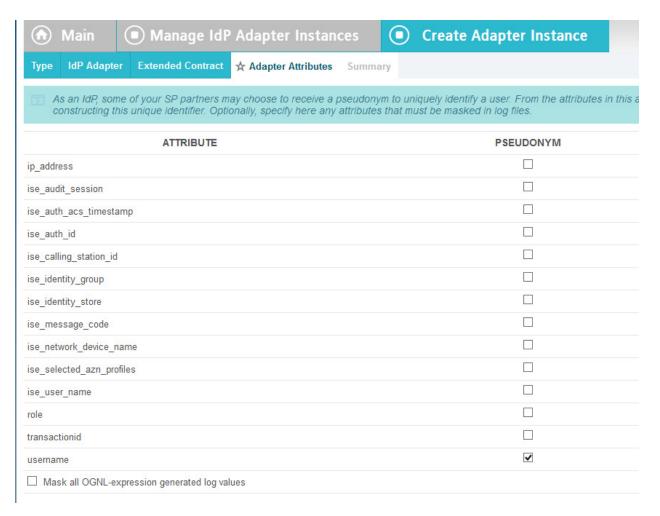

- 1552 13. Click **Next**.
- 1553 14. Add the attributes from both the ISE and RSA adapters.

1555 15. Click **Next**.

1556 16. Check the **Pseudonym** box next to username.

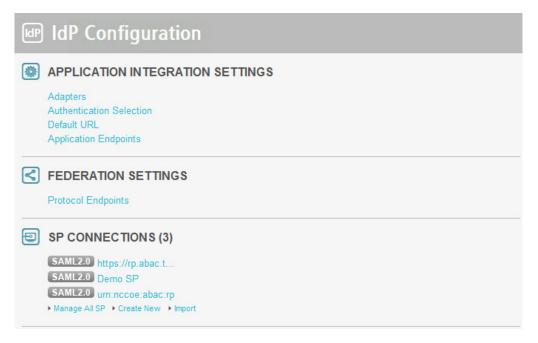

1562

- 1558 17. Click **Next**.
- 1559 18. Click **Done**.
- 1560 19. Click **Save**.

1561 2.13.10 Applying the Composite Adapter

1. From the main page, click on **rp.abac.test** under SP Connections.

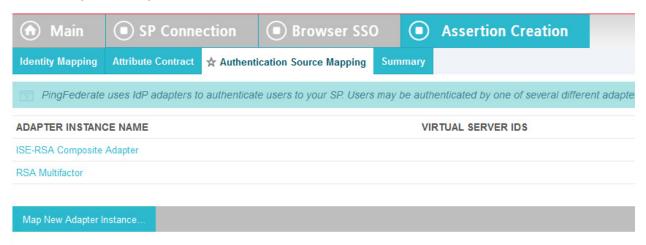

1564 2. Scroll down and click on Authentication Source Mapping.

AUTHENTICATION SOURCE MAPPING

Adapter instance name	ISE-RSA Composite Adapter
Adapter instance name	RSA Multifactor

15651566

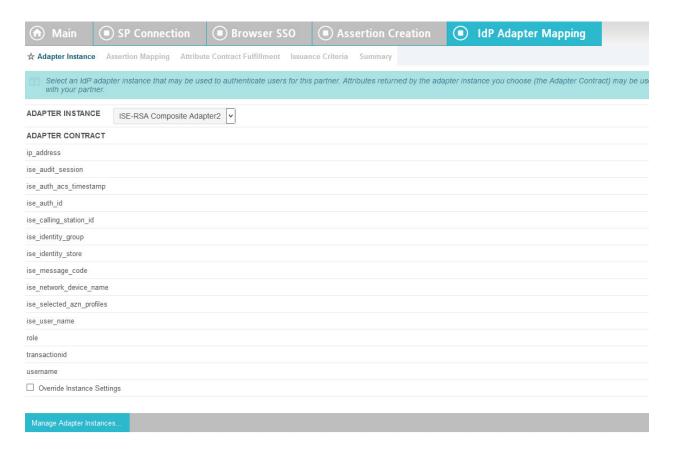

3. Click on Map New Adapter Instance.

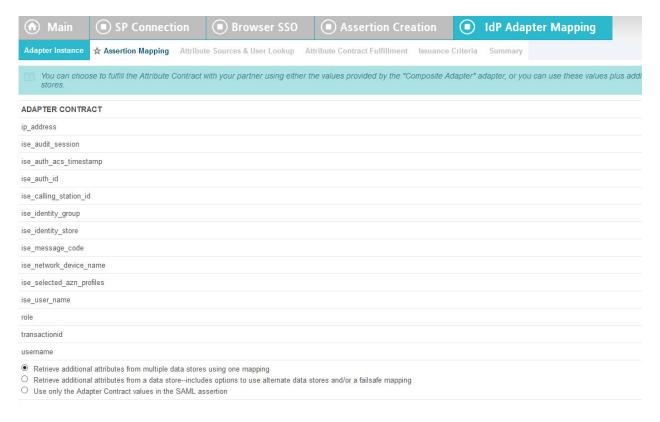

1567

1568

4. In the **Adapter Instance** box, select the composite adapter.

- 1570 5. Click **Next**.
- 1571 6. Select the top radio button labeled **Retrieve additional attributes from multiple data stores**1572 **using one mapping**.

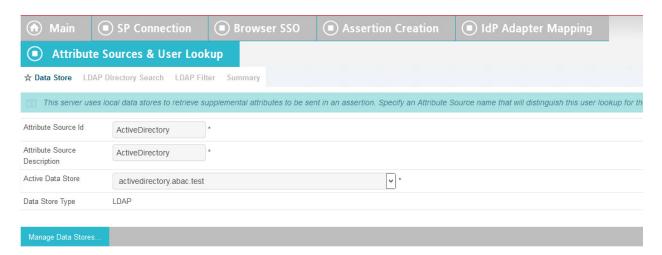

1573

- 1574 7. Click **Next**.
- 1575 8. Click Add Attribute Source.

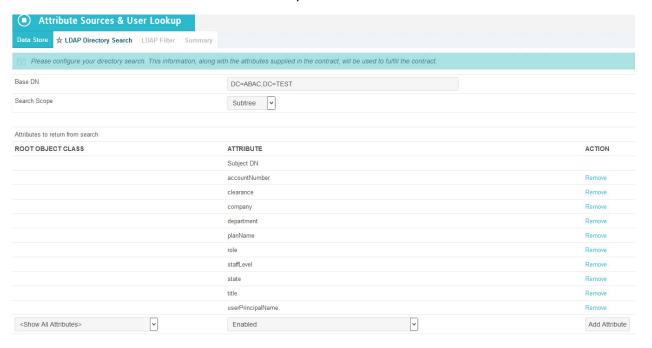

- 9. Enter **ActiveDirectory** for Source Id and Description.
- 1578 10. Select activedirectory.abac.test in the Active Data Store drop-down.

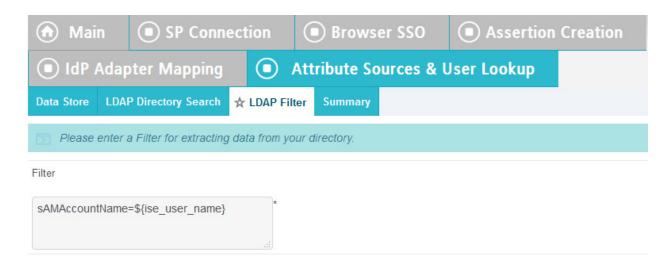

1579

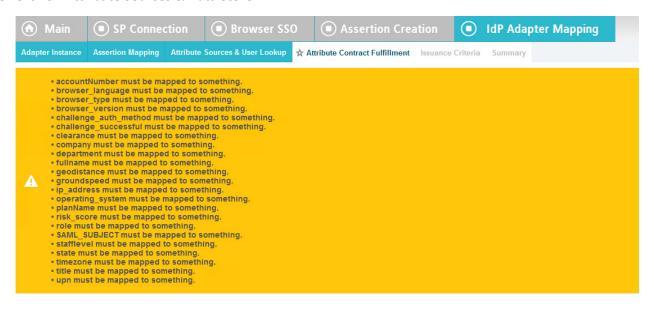

- 1580 11. Click **Next**.
- 1581 12. In the BaseDN field, enter **DC=ABAC,DC=TEST**.
- 13. Add all of the attributes from the LDAP Directory Search.

- 1584 14. Click **Next**.
- 15. In the Filter field, enter sAMAccountName=\${ise_user_name}.

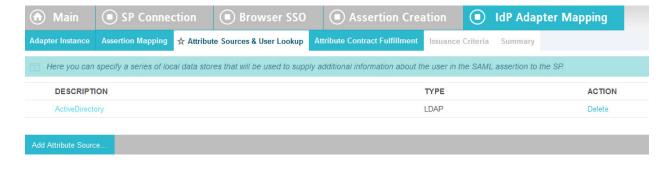

- 16. Click Next.
- 1588 17. Click **Save**.
- 1589 18. Click on Attribute Sources & Data Store.

1590

1591

19. Click on Add Attribute Source.

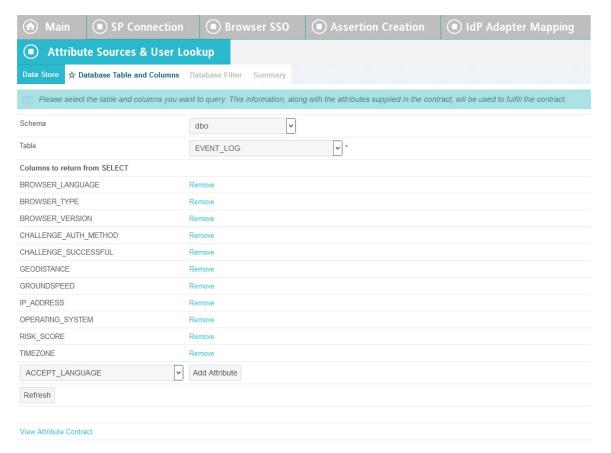

15921593

20. Enter **RSAAA** for Source Id and Description.

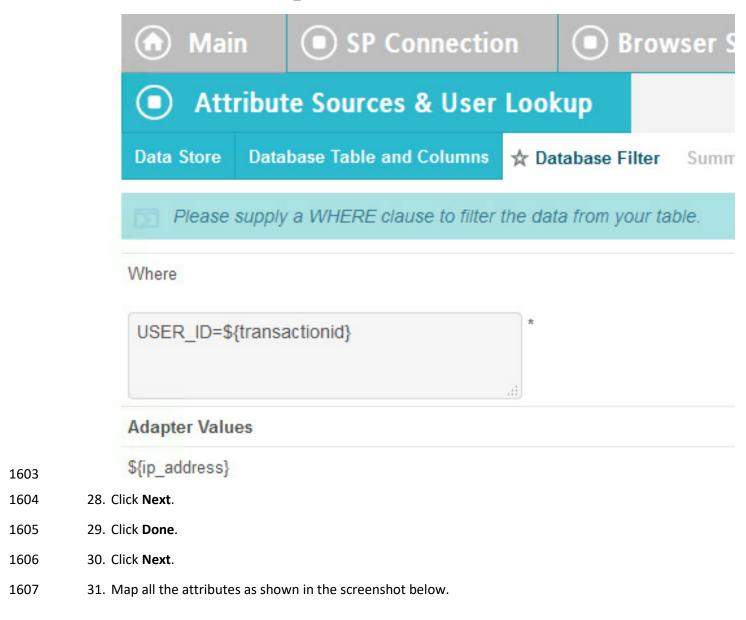

1594 21. Select **JDBC:sqlserver** in the Active Data Store drop-down.

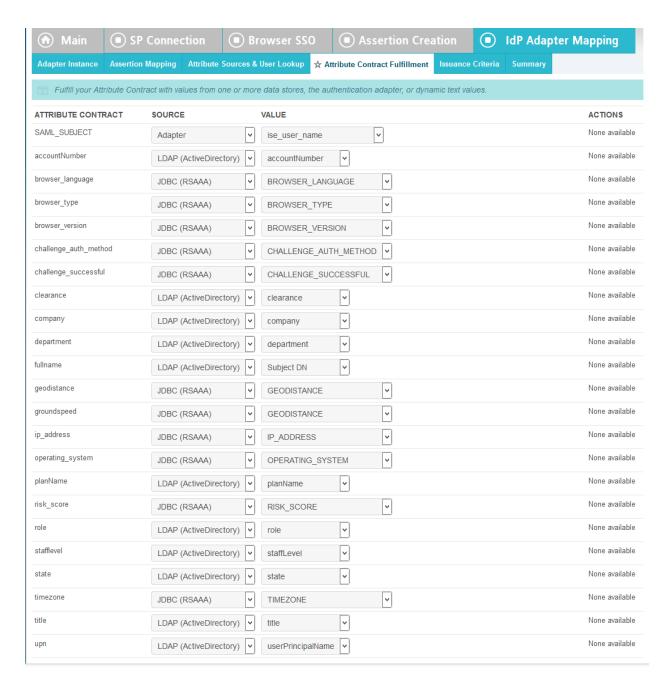

- 1595
- 1596 22. Click **Next**.
- 1597 23. Select **dbo** in the Scheme drop-down.
- 1598 24. Select **EVENT_LOG** in the Table drop-down.
- 1599 25. Add each of the columns from the table.

- 1601 26. Click **Next**.
- 27. In the Where field, enter USER_ID=\${transactionid}.

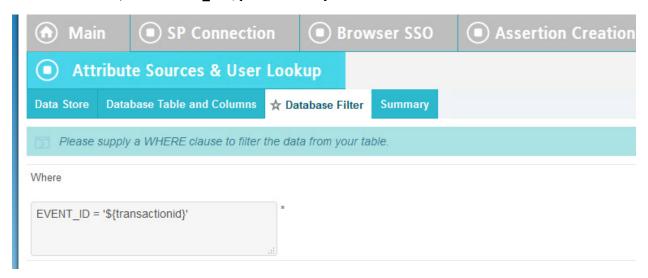

- 1609 32. Click **Next**.
- 1610 33. Click **Next**.
- 1611 34. Click **Save**.
- 35. Back at the main page, click on **rp.abac.test** under SP Connections.

- 36. Scroll down and click on **Database Filter**.
- 1615 37. In the Where field, enter **EVENT_ID=**\${transactionid}.

1616

1618

1619

1620

1621

16221623

1617 38. Click **Save**.

2.14 Certificates

Once you have installed the various products for this ABAC build, you can replace the default self-signed certificates with certificates signed by a Certificate Authority (CA). For our build, we used Symantec's Managed PKI Service to sign our certificates using a local CA. Certificates were used to support various exchanges that require encryption, such as digital signature, SAML message encryption, and encryption of TLS communications.

1629

1645

1646

1647 1648

1649

1655

- Although the detailed instructions of configuring certificates signed by a CA vary by vendor product, the general process is described below. For each certificate, you perform the following high-level steps:
- 1. Using the vendor product (e.g., PingFederate, SharePoint), generate a certificate signing request on the server where you want to use the certificate. Save the signing request to a file.
 - 2. Submit an enrollment request to your CA. You will need to provide the signing request that was generated in Step 1. This step is typically where you provide information such as the name of the server you intend to use the certificate on (e.g., "idp.abac.test").
 - 3. A representative at the CA will examine the enrollment request and approve it. The representative will issue a certificate response signed with the CA's key. You can download the signed response. If you are using a CA that is locally managed by your organization, you will also need to download the public key of the CA, because you will need to add this the Trusted Certificate Authorities on each server and client that will be using the certificates.
 - 4. Go back to the vendor product where you created the certificate signing request. If you are using a local CA, you will first need to add the Certificate Authority's public key to the list of Trusted Certificate Authorities.
 - 5. Import the certificate file for your server that was signed by the CA.

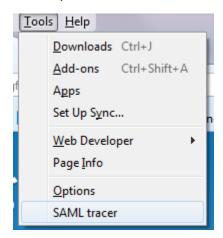

2.14.1 Certificate Configuration PingFederate

- In the PingFederate app, on the main menu, under Certificate Management, click Trusted CAs to import the public key of your local CA. If you are using a well-known, external, major CA and that authority's public key is already available in cacerts in the Java runtime, it is not necessary to import the same certificate into the PingFederate Trusted CA store.
 - For SSL Server certificates, follow the instructions in the link below. The applicable sections are "To create a new certificate," "To create a certificate-authority signing request," and "To import a certificate authority response." Once you have imported a signed certificate response, you will need to active the certificate on the PingFederate runtime server instance on which your applications are running. Follow the instructions in the section "To activate a certificate."
- 1650 https://documentation.pingidentity.com/display/PF73/SSL+Server+Certificates
- For digital signatures and performing encryption / decryption, follow the instructions in the link below. The applicable sections are the same as for SSL Server certificates.
- 1653 https://documentation.pingidentity.com/display/PF73/Digital+Signing+and+Decryption+Keys+a
 1654 https://documentation.pingidentity.com/display/PF73/Digital+Signing+and+Decryption+Keys+a
 1654 <a href="https://documentation.pingidentity.com/display/PF73/Digital+Signing+and+Decryption+Keys+a

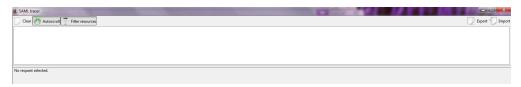

2.15 Functional Test of All Configurations for Section 2

- 1656 The instructions in this section will help perform an integrated test all of the configurations in Section 2.
- 1657 Using the browser and PingFederate, a user will log on and validate that the federated authentication to
- 1658 Microsoft AD and RSA AA are properly configured.
- 1659 The test for this section was performed using the Mozilla Firefox browser and the "SAML tracer" add-on,
- which enables examination of HTTPS POST and SAML messages.

- 1661 1. Install the Firefox SAML tracer add-on from the link below.
- 1662 https://addons.mozilla.org/en-Us/firefox/addon/saml-tracer/
- 1663 2. Launch your Firebox browser and select **SAML tracer** from the Tools menu.

This will launch an empty SAML tracer window.

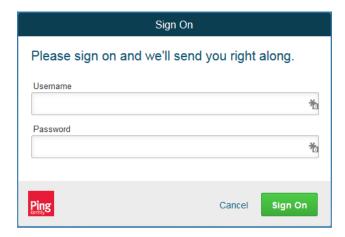

1666 1667

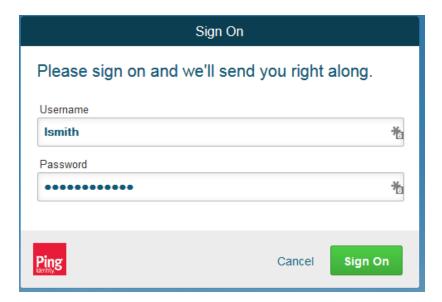

1668

1671

- 3. Minimize the SAML tracer window. The SAML tracer will automatically record the details of the HTTPS messages in the background.
- 4. Go back to the main browser window and navigate to the Identity Provider's SSO Application 1669 1670 Endpoint URL identified in the previous section (e.g.,
 - https://idp.abac.test:9031/idp/startSSO.ping?PartnerSpId=https://rp.abac.test:9031).
- Expected Result: You should see the PingFederate Sign On screen. 1672

- 5. Enter the **Username** of the account created in Microsoft AD earlier in this section (e.g., **Ismith**). 1674
- 6. Enter an invalid password for the account. Do not enter the correct password.

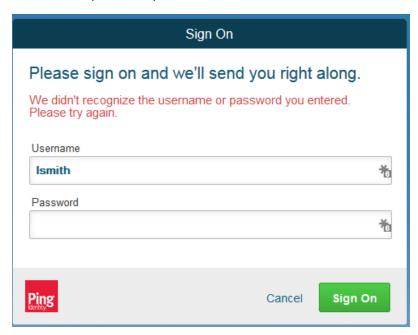

1678

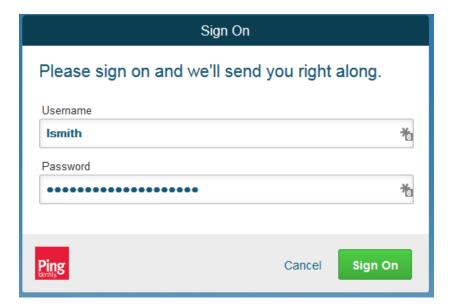

1679

7. Click Sign On.

<u>Expected Result</u>: You should see an error message that states, "We didn't recognize the username or password you entered."

- 8. Close the existing browser and launch a new browser.
- 9. Navigate to the Identity Provider's SSO Application Endpoint URL again.
- 10. Enter the user name of the account created earlier in this section (e.g., **Ismith**). Then, enter the correct password.

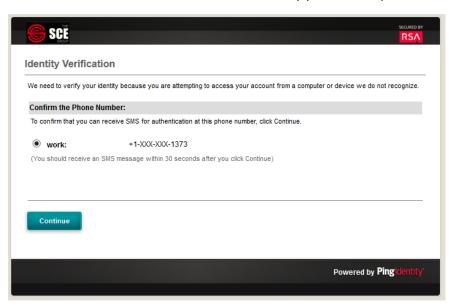

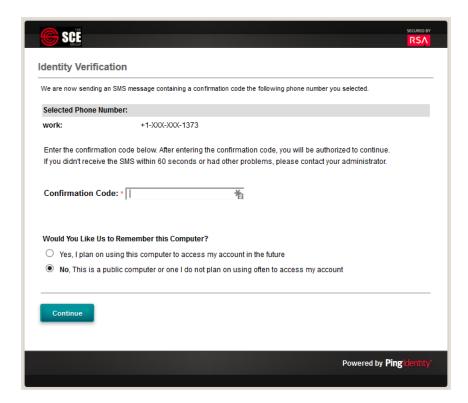

1686

1687 1688

11. Click Sign On.

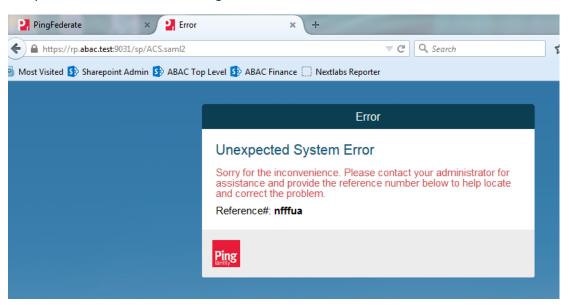

<u>Expected Result</u>: You should see the two-factor RSA AA plug-in screen. This screen prompts you to enter the SMS text validation code received by your mobile phone.

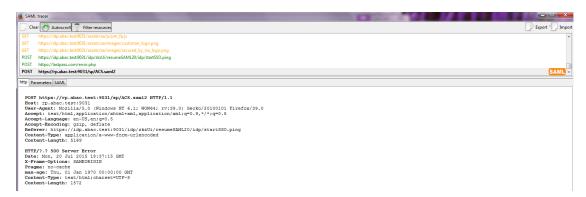

12. Enter the SMS validation code received on your mobile phone and proceed. This will initiate a communication with the RSA AA server to validate the code that was entered.

<u>Expected Result</u>: The browser should redirect to the RP's Federation Server (e.g., **rp.abac.test**), and you should see an error message similar to the screenshot below.

 13. Go back to the SAML tracer window. Scroll to the bottom of the list of messages in the upper pane. Click on the last message (e.g., POST https://rp.abac.test:9031/sp/ACS.saml2) that has a SAML icon associated with it. This will show the details of the POST message.

<u>Expected Result</u>: In the details page at the bottom, on the **http** tab, you should see that the browser sent a **POST** message to the RP's PingFederate server **rp.abac.test**. The HTTP response status code (identified on the line that begins with **HTTP**) should be a **500 Server Error**.

14. Click on the **SAML** tab.

<u>Expected Result</u>: You should see the details of the SAML message, including the Issuer. The Issuer should be the IdP's Federation server, **idp.abac.test**.

3 Setting up Federated Authentication Between the Relying Party and the Identity Provider

3.1 Introduction

In the previous section of this How-To Guide we demonstrated how to set up federated, SAML-based authentication at the identity provider (IdP). Before continuing with this section, it is necessary to have a working federation service that will represent the identity provider and can receive and issue SAML 2.0 request and responses. For instructions on how to set this up using Ping Federate, please refer to Section 2 of this guide.

- 1715 In order to federate identities and attribute information between organizations a federation service
- must exist at both the identity provider and the relying party (RP). A trust relationship between these
- 1717 two services must then be instantiated to allow for identity and attribute requests and responses. In this
- 1718 section we configure an instance of PingFederate (henceforth called PingFederate-RP) at the relying
- 1719 party to act as a federation service and to redirect users to the PingFederate-IdP via a SAML request. We
- then configure the trust relationship and federated authentication between the PingFederate-RP and
- 1721 the PingFederate-IdP, allowing the SAML request to be processed by the identity provider and the
- 1722 subsequent return of a SAML response containing identity and attribute assertions.
- 1723 If you follow the instructions in this How-To Guide section, you will be able to perform a functional test
- to verify the successful completion of the steps for installing, configuring, and integrating the
- 1725 components.

1743

17441745

1746

1747

3.2 Components

- 1727 Federated authentication between the relying party and the identity provider involves the following
- 1728 distinct components:
- 1729 PingFederate-IdP: A federation system or trust broker for the identity provider
- 1730 PingFederate-RP: Serves as the trust broker for SharePoint

1731 3.2.1 PingFederate-IdP

- 1732 Ping Identity PingFederate-IdP serves as a federation system or trust broker for the IdP. PingFederate-
- 1733 IdP provides initial user authentication and retrieval of user attributes to satisfy SAML requests from the
- 1734 RP. Once the user has been authenticated, PingFederate-IdP queries subject attributes from AD and
- 1735 environmental attributes from the RSA AA event log. PingFederate-IdP takes the name:value pairs of
- both the subject and environmental attributes and stores them in a SAML 2.0 token to be sent to the RP.

PingFederate Usage Notes:

- When using the PingFederate application to perform an administrative configuration, there is usually a sequence of screens that require user entry, ending with a summary page. Once you click **Done** on the summary page, you must also click **Save** on the following page to save the configurations. If you forget to click **Save**, you may inadvertently lose changes to the configuration.
- In the PingFederate application and associated documentation, the relying party is referred to as the "Service Provider."
- When using the PingFederate application to perform configuration, refer to the title of the tab with a small star icon to its left, to identify the item you are currently configuring. For example, if you navigated to the following screen, you would be on the IdP Adapter screen.

- 1749 3.2.2 PingFederate-RP
- 1750 Ping Identity PingFederate-RP serves as the trust broker for SharePoint. When the user requires
- authentication, PingFederate-RP redirects the user to the IdP via a SAML request to get the necessary
- 1752 assertions. Once authenticated, PingFederate-RP arranges for the browser's HTTPS content to have the
- 1753 proper information in proper format for acceptance at the target resource (SharePoint).

3.3 Export Metadata from the Identity Provider

- 1755 Follow the instructions in this section to export a metadata file from the PingFederate-IdP.
- 1756 1. Logon to the server that hosts the PingFederate service for the Identity Provider.
- Launch your browser and navigate to the PingFederate application URL:
 https://<DNS NAME>:9999/pingfederate/app.
 - 3. Replace DNS_NAME with the fully qualified name of the Identity Provider's PingFederate server (e.g., https://idp.abac.test:9999/pingfederate/app). Logon to the PingFederate application using the credentials you configured during installation.
 - 4. On the Main Menu under Administrative Functions, click Metadata Export.
 - 5. On the Metadata Mode screen, select **Use a connection for metadata generation**.

1764

1765

1766

1767

1754

1759

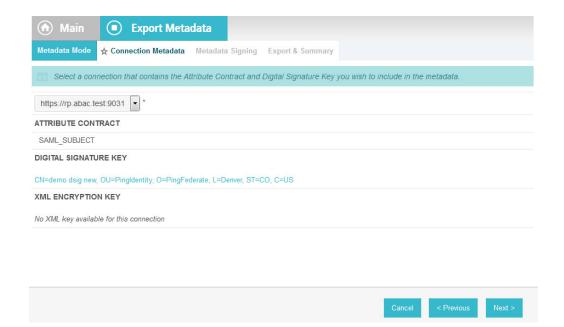

1760

1761

1762

1763

6. Click **Next**. On the Connection Metadata screen, select the connection to the relying party that you configured in the previous section (e.g., *https://rp.abac.test:9031*). This should automatically populate some of the fields on the screen with information from the connection.

1768

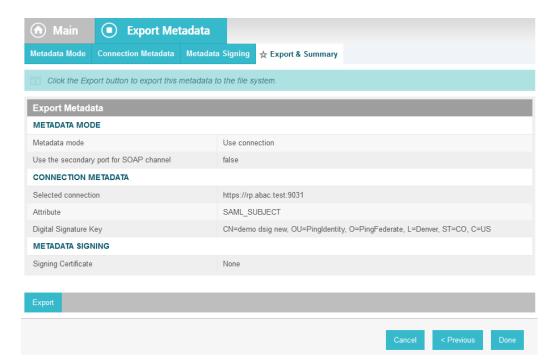

1769 1770 7. Click **Next**. On the Metadata Signing screen, if you plan to sign the metadata file that will be exported, select the certificate that will be use to sign the file.

17711772

1773

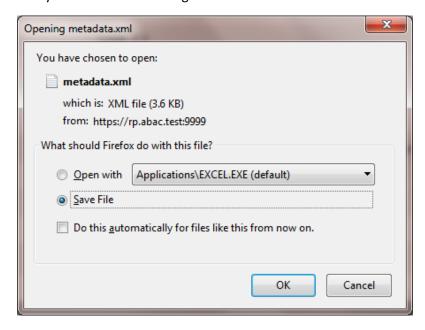

8. Click **Next**. On the Export & Summary screen, you should see a summary of the options that were selected.

1775

1776

9. Click **Export**. This will create an export file that contains the metadata of the identity provider that you can download using the browser.

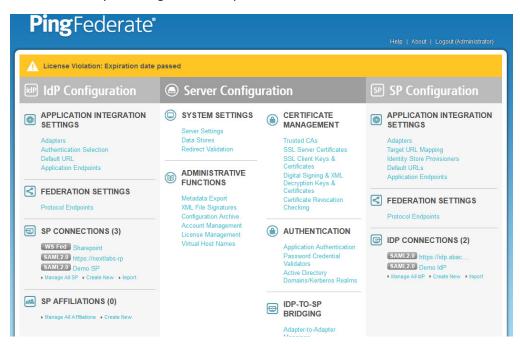

17771778

10. Copy the metatdata file to the server that hosts the PingFederate service for the relying party.

1779 3.4 Configure PingFederate-RP Connection to the PingFederate-IdP

- Follow the instructions in this section to configure a PingFederate connection from the relying party to the identity provider.
- 1782 1. Logon to the server that hosts the PingFederate service for the relying party.
- 2. Launch your browser and go to: https://<DNS NAME>:9999/pingfederate/app.
 - 3. Replace DNS_NAME with the fully qualified name of the relying party's PingFederate server (e.g., https://rp.abac.test:9999/pingfederate/app). Logon to the PingFederate application using the credentials you configured in the previous installation section.

17871788

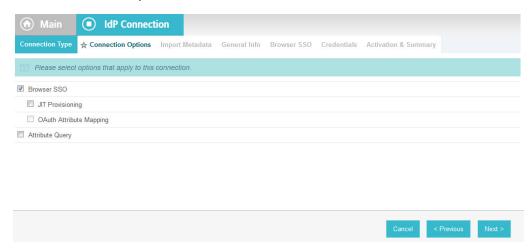

1784

- 4. On the Main Menu under IDP CONNECTIONS, click Create New.
- 5. On the Connection Type screen, select **Browser SSO Profiles**.

1790

- 1791 6. Click **Next**.
- 7. On the Connection Options screen, make sure **Browser SSO** is selected.

- 1794 8. Click **Next**.
- 9. On the Import Metadata screen, click **Browse** and select the metadata file that you exported from the Identity Provider's PingFederate server.

Cancel < Previous Next >

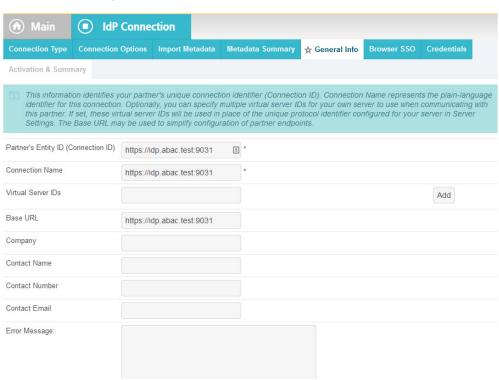

1798 10. Click **Next**.

1799

1800

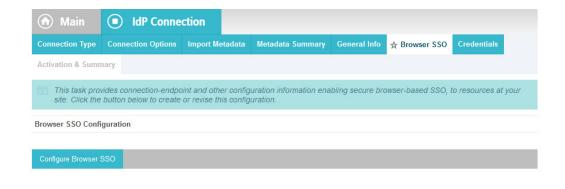

1801

11. On the Metadata Summary screen, click **Next**. On the General Info screen, you should see some configuration information (e.g., Base URL) about the identity provider that was taken from the metadata file that you selected.

1802

1803 12. Click **Next**.

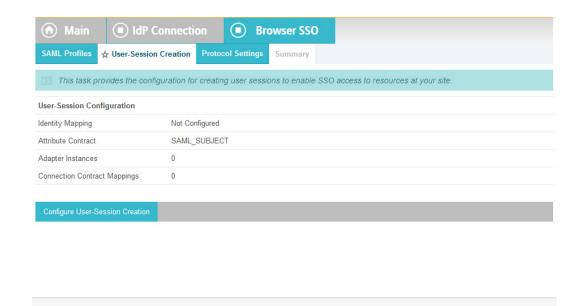

Save Draft Cancel < Previous Next >

- 1805 13. On the Browser SSO screen, click **Configure Browser SSO**.
- 1806 14. On the SAML Profiles screen, select IdP-Initiated SSO and SP-Initiated SSO.

1807

1808 15. Click **Next**.

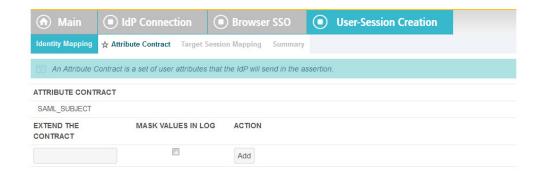

1809

1810 16. On the User-Session Creation screen, click **Configure User-Session Creation**.

18751876

47. On the Summary screen, click **Done**.

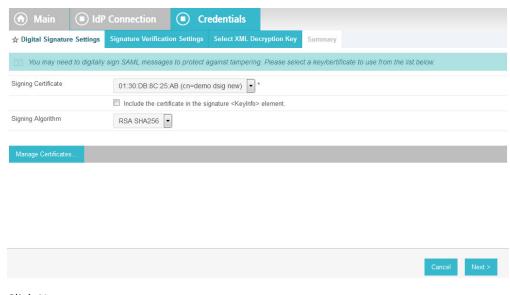

1877 1878

48. On the Browser SSO screen, click **Next**.

1879

- 1880 49. On the Credentials screen, click **Configure Credentials**.
- 1881 50. On the Digital Signature Settings screen, select
 - a. Signing Certificate for SAML messages and
- 1883 b. Signing Algorithm

1885 51. Click **Next**.

1884

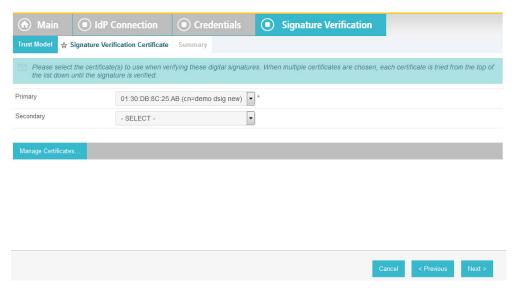

1886

1887 52. On the Signature Verification Settings screen, click **Manage Signature Verification Settings**.

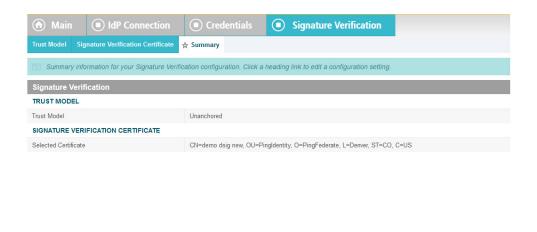

1888

- 1889 53. On the Trust Model screen, click **Next**.
- 1890 54. On the Signature Verification Certificate screen, select the certificate to verify digital signatures.

1892 55. Click **Next**.

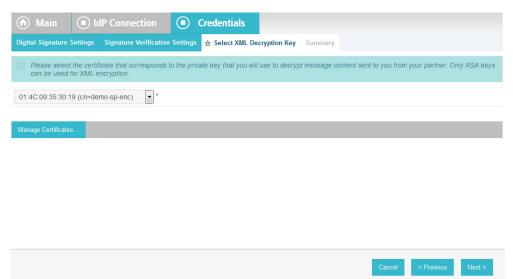

1893

1894

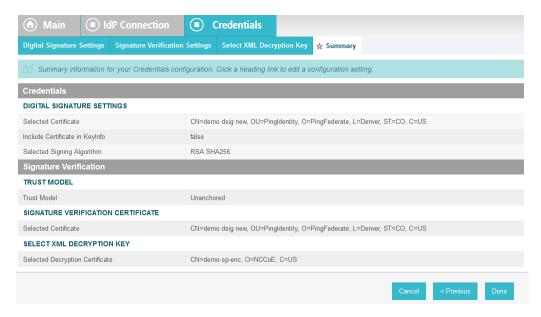

1895

- 56. On the Summary screen, click **Done**.
- 57. On the Signature Verification Settings screen, click **Next**.
- 1896 58. On the Select XML Decryption Key screen, select the certificate associated with the private key that will decrypt messages from the identity provider.

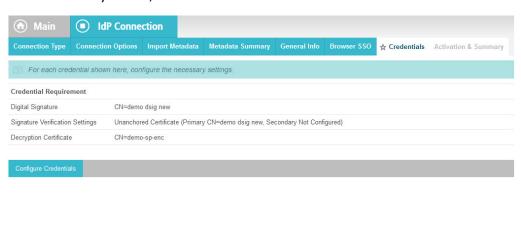

1898

1899 59. Click **Next**.

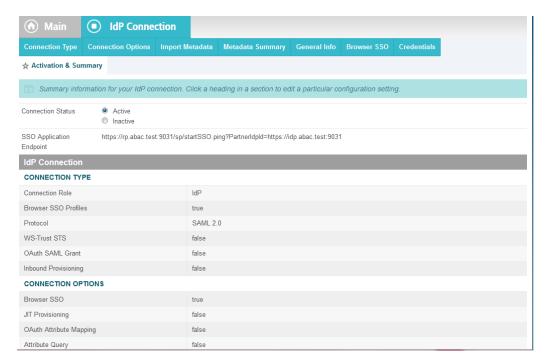

1900

1901 60. On the Summary screen, click **Done**.

- 61. On the Credentials screen, click Next.
- 1904 62. On the Activation and Summary screen, select **Active** for the **Connection Status** field.

1906

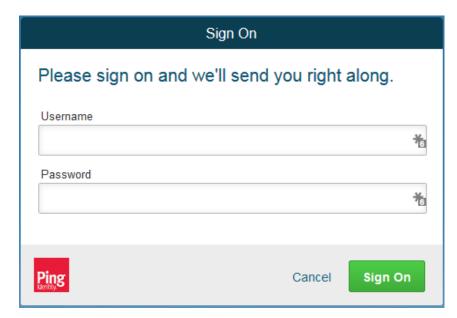

1917

1918

- 63. Copy the relying party's SSO Application Endpoint URL (e.g., https://rp.abac.test:9031/sp/startSSO.ping?PartnerIdpId=https://idp.abac.test:9031) to the 1907 1908 clipboard and save it to a text file, because this URL will be used in the Functional Test section.
- 1909 64. Click Save to save the configuration.

Functional Test of All Configurations for Section 3 1910

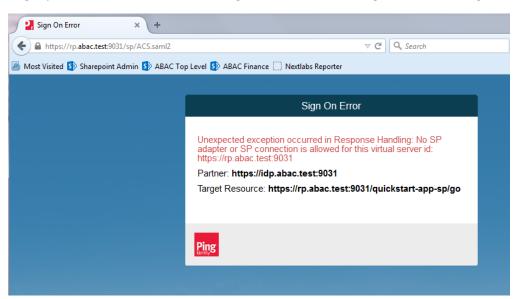

- This section provides instructions to perform an integrated test all of the configurations in Section 3. 1911
- 1912 1. Using the browser and PingFederate, a user will logon at the identity provider, and then get redirected to the relying party. 1913
- 1914 Note: This test is similar to the test in Section 2, except this time the relying party has a destination endpoint connection that was configured in Section 3, so the response code from 1915 1916 the relying party's Federation server (e.g., rp.abac.test), should be an HTTP 200 status code.
 - 2. Launch your browser and navigate to the relying party's SSO Application Endpoint URL identified in the previous section (e.g.,
- 1919 https://rp.abac.test:9031/sp/startSSO.ping?PartnerIdpId=https://idp.abac.test:9031).
- 1920 3. Launch the SAML tracer as in <u>Section 2</u> and minimize the tracer window.
- 1921 Expected Result: You should see the PingFederate Sign On screen.

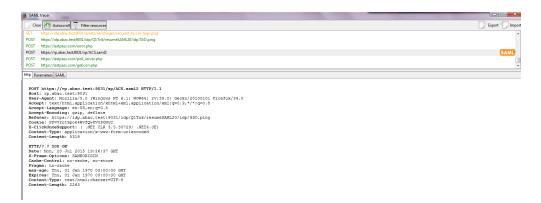

1924

1926 1927

- 4. Enter the Username and Password of the account created in <u>Section 2</u> (e.g., "Ismith") and click Sign On.
- 1925 5. When the RSA Adaptive Authentication screen comes up, enter the SMS text validation code.
 - <u>Expected Result</u>: You should see the browser redirect to the relying party's Federation Server (e.g., rp.abac.test) and an error message similar to the message in the following screenshot.

- 6. Return to the SAML tracer window.
- 7. Scroll to the bottom of the list of message in the upper pane.
- 8. Click on the last message (e.g., POST https://rp.abac.test:9031/sp/ACS.saml2) that has a SAML icon associated with it. This will show the details of the POST message.

1935

1936 1937

1938

1939

1940

1950

1951

1952

1953

1954

1955

1956

1957

1958 1959

1960

1961

<u>Expected Result</u>: In the details page at the bottom, on the **http** tab, you should see that the browser sent a POST message to the relying party's PingFederate server (e.g., rp.abac.test). The HTTP response status code (identified on the line that begins with "HTTP") should be a 200 OK code.

4 Installing and Configuring Microsoft SharePoint Server and Related Components

4.1 Introduction

- In previous sections of this How-To Guide, we installed several products to establish RP and IdP environments, their components, and the federation between them (Section 2 and Section 3).
- 1943 In this section of the How-To Guide we will illustrate how to install IIS (Internet Information Services 8),
- 1944 Microsoft SQL Server 2012, and Microsoft SharePoint Server 2013. Then, within SharePoint we will
- illustrate how to create a web application, configure the web application to run SSL, create a site
- 1946 collection, and create sub-sites.
- In our build, we used ABAC policies and policy enforcement to protect RP resources like SharePoint sites and documents with the help of NextLabs products installed in subsequent How-To sections (Section 7

1949 and <u>Section 8</u>).

4.1.1 Components Used in this How-To Guide

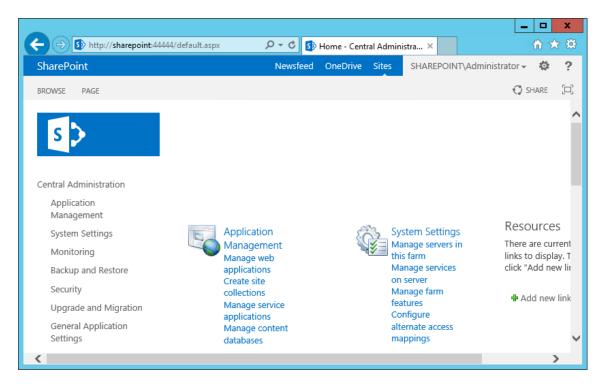

- Internet Information Services (IIS) Manager extensible web server created by Microsoft (formerly Internet Information Server) and is pre-installed in most Windows editions though is not active by default.
- 2. Microsoft SharePoint 2013 Microsoft SharePoint is a web-based application within the Windows operating environment. Commonly, SharePoint is deployed as a document management system for intranet, extranet, or cloud repository purposes. SharePoint natively uses an RBAC authorization environment, but it also supports the use of attributes within the user transaction request, a capability Microsoft refers to as being "claims aware." SharePoint also allows for tagging data within its repository, which can be leveraged as object attributes.

Microsoft SQL Server 2012 - relational database management system developed by Microsoft. As a database server, it is a software product with the primary function of storing and retrieving data.

1962 4.1.2 Required or Recommended Files, Hardware, and Software

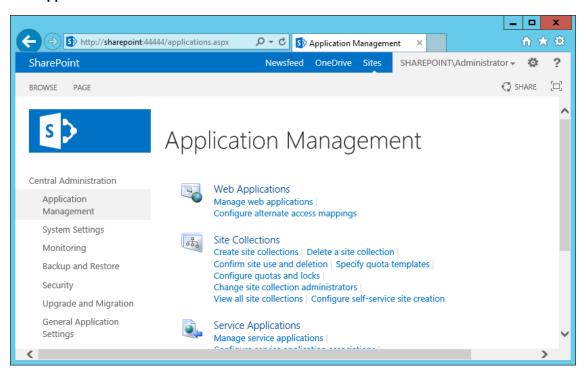

Component	Required Files	Required Other Software	Minimum Hardware Requirements	Recommended Hardware	Recommended or Minimum Operating System	Operating System or Other Software Used in this Build
Internet Information Services (IIS) 8	Built-in component in Windows Server 2012 operating system (inactive by default) – Windows Server 2012 ISO	N/A	For the Windows 2012 Server OS: 512 MB RAM, 1.4 GHz 64-bit CPU, 32 GB hard disk; Gigabit Ethernet adapter	For the Windows 2012 Server OS: 800+ MB RAM, >1.4 GHz 64-bit CPU, >32 GB hard disk	Windows Server 2012 R2 Standard 64-bit	Windows Server 2012 R2 Standard 64-bit
Microsoft SharePoint Server 2013	SharePoint Server 2013 in- stallation setup file or DVD	Microsoft SQL Server 2012; Microsoft SQL Server Manage- ment Studio; IIS 7.0 or 8.0 (Web Server Role, 8.0 required for Windows Server 2012)	12 GB RAM, 4 core, 64 bit CPU, 80 GB hard disk space for system drive	8+ GB RAM, 4+core 64-bit CPU, >80 GB hard disk	The 64-bit edition of Windows Server 2008 R2 Service Pack 1 (SP1) Standard, Enterprise, or Datacenter or the 64-bit edition of Windows Server 2012 Standard or Datacenter	Windows Server 2012 R2 Standard 64-bit
Microsoft SQL Server 2012	SQL Server 2012 setup file or DVD	.NET 4.0 Framework (SQL Server installs .NET 4.0 during the feature installation step.)	1GB RAM, 1.4GHz CPU, 6 GB of hard- disk space	4 GB RAM (should be increased as database size in- creases to ensure optimal perfor- mance), >2.0 GHz CPU, 6 GH of hard-disk space	Windows Server 2008 R2 or Win- dows Server 2012, Windows 8.1, Win- dows 8, Windows 7 SP1, Windows Vista SP2	Windows Server 2012 R2 Standard 64-bit

1964	4.2	Installation of Required Components				
1965 1966 1967	4.2.1 Installing SQL Server 2012 On the server where SQL Server 2012 is going to be installed, follow the steps from this link to install SQL Server 2012: https://technet.microsoft.com/en-us/library/ms143219(v=sql.110).aspx					
1968 1969 1970 1971	Note: in our build, this SQL Server instance is leveraged by SharePoint Server 2013 and by the NextLabs ABAC policy definition, deployment, and enforcement components. Two of these NextLabs components are also installed on the same server as SQL Server 2012 (Section 7). In our build, we call this server SQLServer.					
1972 1973 1974	Center	nerally recommended by Microsoft regarding SharePoint Server and NextLabs regarding Control that the SQL Server be installed on a separate, dedicated server, which is why we chose that ment in our build.				
1975 1976 1977 1978	link to	Installing IIS 8.0 on the SharePoint Server separate server where SharePoint Server 2013 is going to be installed, follow the steps from this install IIS 8.0 (if not already installed; required for SharePoint Server 2013): www.iis.net/learn/get-started/whats-new-in-iis-8/installing-iis-8-on-windows-server-2012				
1979	Note: i	n our build, we call this the SharePoint Server.				
1980 1981 1982 1983 1984	link to	Installing Microsoft SharePoint Server 2013 separate server where SharePoint Server 2013 is going to be installed, follow the steps from this install SharePoint Server 2013: social.technet.microsoft.com/wiki/contents/articles/14209.sharepoint-2013-installation-step-by-spx				
1985	<u>Note</u> : i	n our build, we call this the SharePoint Server (same as step 2.2).				
1986 1987	4.3 1.	Creating the Web Application (IIS site) in SharePoint On the SharePoint Server, open a web browser.				
1988 1989	2.	In the URL address bar of the browser, enter the address for Central Administration and click Enter or Go: http://sharepoint:44444/default.aspx				
1990	3.	From the Central Administration page, click on Application Management .				

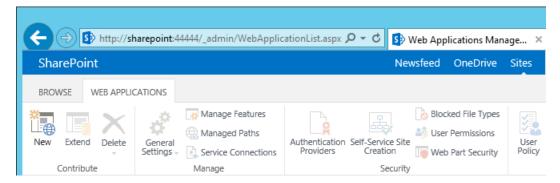

1993

4. On the Application Management Page, under the Web Applications section, click on **Manage** web applications.

19941995

5. From the left-most end of the Web Applications ribbon menu click on New.

6. In the Create New Web Application window that automatically opens, in the IIS Web Site section, do the following steps to choose the web application's basic IIS configuration:

1999

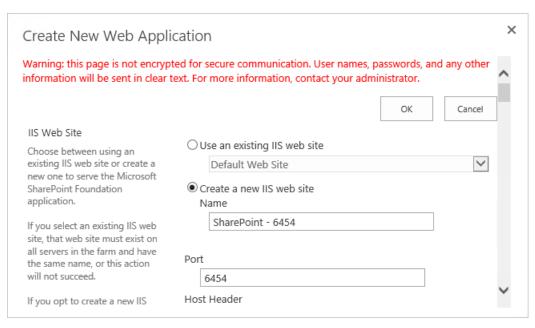

1998

a. Leave the radio button for Create a new IIS web site chosen (default).

2000

b. Leave the default **Name** or change the **Name** to something more memorable to you.

2001 2002 Leave the default **Port** displayed or change the **Port** number to one that makes sense for your environment.

20032004

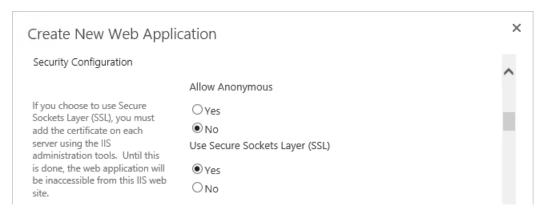

d. Leave the **Host Header** blank and keep the default **Path**.

If you opt to create a new IIS web site, it will be automatically created on all servers in the farm. If an IIS setting that you wish to change is not shown here, you can use this option to create the basic site, then update it using the standard IIS tools.

HOS	t Header

	\inetpub\wwwroot\wss\VirtualDirectories\6454

SECOND DRAFT

- 7. Further down in the Create New Web Application window, in the Security Configuration section, do the following steps to configure the web application to run SSL:
 - a. Under **Allow Anonymous** leave the **No** radio button chosen (default).
 - b. Under Use Secure Sockets Layer (SSL), click Yes.

20102011

2012

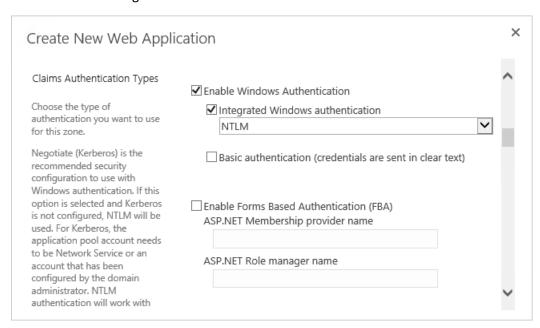

2013

2014

2008

2009

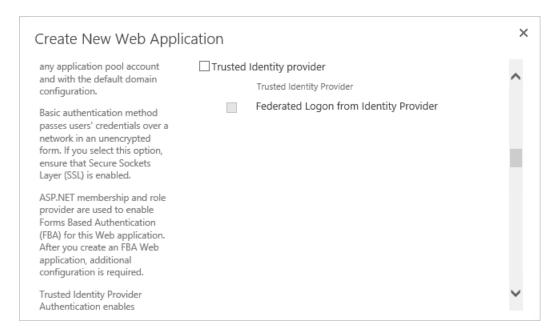

- 8. Further down in the Create New Web Application window, in the Claims Authentication Types section, do the following steps to enable Windows Authentication (as illustrated):
 - a. Click on Enable Windows Authentication
 - b. Click on Integrated Windows authentication

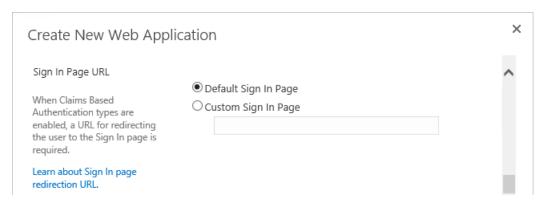

20152016

9. Further down in the Create New Web Application window, in the Claims Authentication Types section, note that there is a **Trusted Identity provider** section. Do not select this option now, but later in our build and in other How-To guide sections there will be steps for setting up the federated logon.

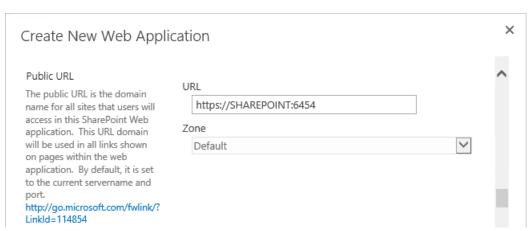

20172018

10. Further down in the Create New Web Application window, in the Sign In Page URL section, leave the **Default Sign In Page** radio button chosen (default).

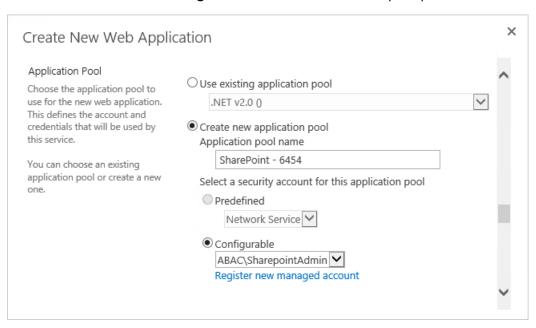

11. Further down in the Create New Web Application window, in the Public URL section, change the URL or keep the default URL:

SECOND DRAFT

- 2027 12. Further down in the Create New Web Application window, in the Application Pool section, leave 2028 the default values: 2029 a. Leave the radio button for **Create new application pool** chosen.
 - b. Note that the Configurable button is already chosen to select an existing security account for the new application pool, an account called SharePointAdmin in this build
 - i. If you do not already have a managed account for this purpose, click on the Register new managed account link and follow the prompts to create one.

13. Further down in the Create New Web Application window, in the Database Name and

Authentication section, leave the following fields filled in with the default information or enter

2034

2030

2031

2032

2033

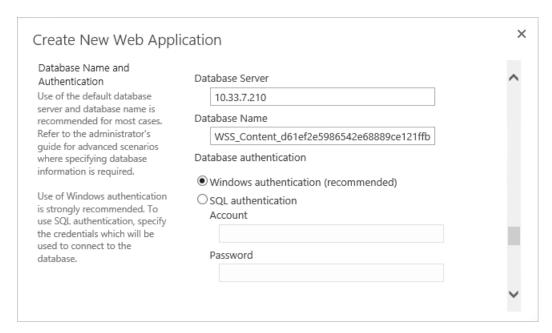

- 2035 2036
- 2037
- 2038 2039

2040

- your own manually: a. IP Address of the Database Server. In our build the separate, dedicated SQL Server IP

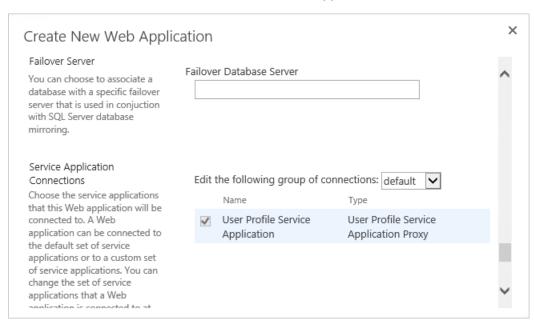

address is 10.33.7.210

b. Database name

2043

- 14. Further down in the Create New Web Application window, in the Failover Server section, leave the **Failover Database Server** field blank.
- 2044 15. Further down in the Create New Web Application window, in Service Application Connections,
 2045 leave the default checkbox for User Profile Service Application checked.

20462047

2048

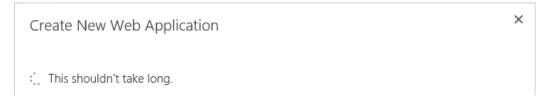

- 16. Further down in the Create New Application window, in Customer Experience Improvement Program, either keep the Enable Customer Experience Improvement Program radio button for No chosen, or click on Yes.
- 17. At the bottom of the Create New Application window click **OK** to finish the web applicationcreation process.

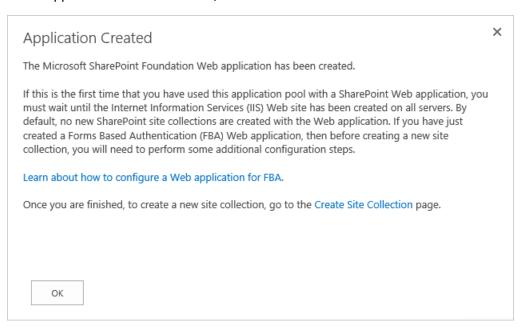

2053

2054

18. Wait for the new web application to be created.

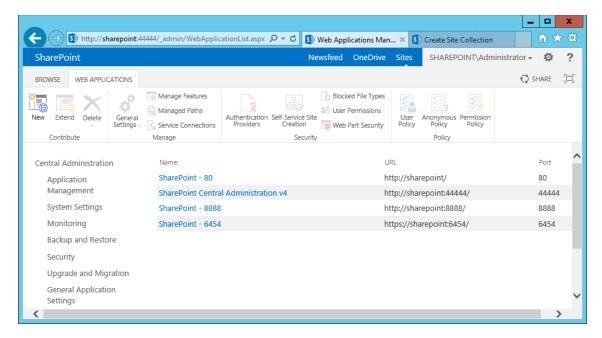

2055 19. In the Application Created window, click **OK**.

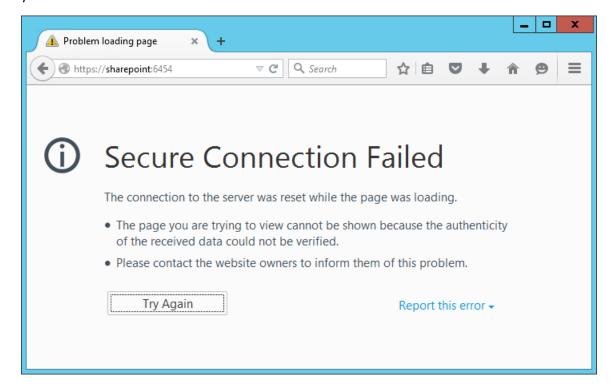

20562057

2058

20. Back on the Web Applications page, verify that your new SharePoint web application is listed ("SharePoint – 6454" from this example).

 21. In another browser window, navigate to your new web application (e.g., https://sharepoint:6454). Until the SSL certificate is installed as seen in the following section, you will receive this error.

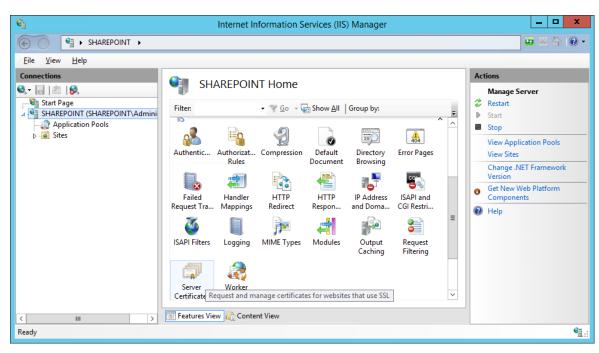

4.4 Creating and Installing SSL Certificate

For a protected lab environment, it is possible to use self-signed certificates, however for production network deployments it is generally recommended to use certificates signed by a Certificate Authority. Instructions related to both approaches are included in this section.

- 2068 4.4.1 Self-Signed Certificates
- 2069 4.4.1.1 Creating a Self-Signed Certificate on IIS 8
- 2070 1. On the SharePoint Server, click on the **Windows** icon in the bottom left corner of your screen.
- 2071 2. Begin typing IIs.
- 3. When the Internet Information Services (IIS) Manager appears, click on it.

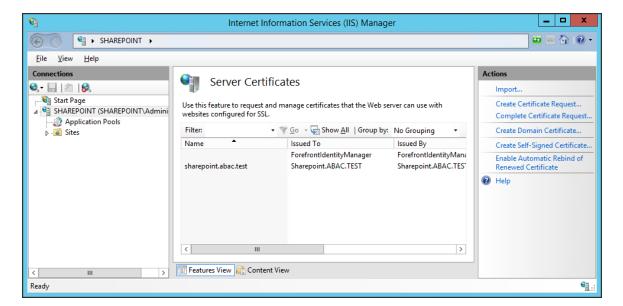

- 4. Click on the **SharePoint Instance** to see its Features.
- 5. Scroll down and double-click on **Server Certificates**.

20762077

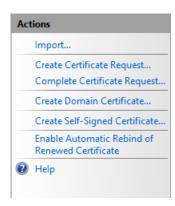

6. In the Server Certificates window, you will see any certificates that already exist.

2079

2080

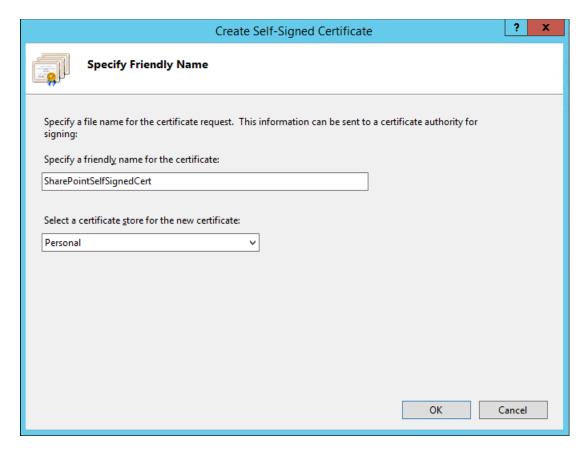

7. In the Actions panel on the right side of the IIS Manager window, next to the Server Certificates window, click on **Create Self-Signed Certificate**.

20812082

2083

8. In the Create Self-Signed Certificate window, **Specify a friendly name for the certificate** and **Select a certificate store for the new certificate**, then click **OK**.

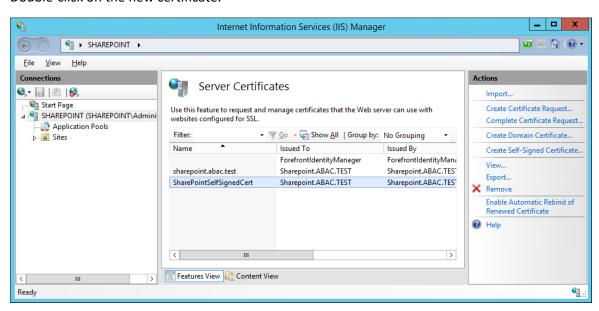

2085

2086

2087

4.4.1.2 Importing Self-Signed Certificate to SharePoint Certificate Store

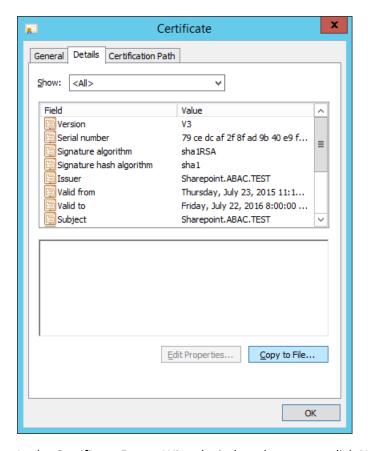

- 1. After creating the self-signed certificate and clicking **OK** in the previous sub-section, you will see your new certificate.
- 2088 2. Double-click on the new certificate.

2089

2090

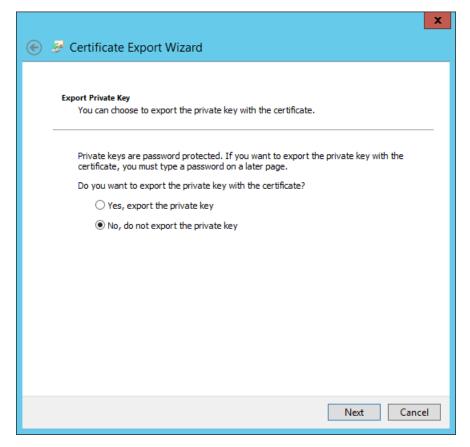

3. In the **Details** tab of the Certificate window, click on **Copy to File**.

4. In the Certificate Export Wizard window that opens, click **Next**.

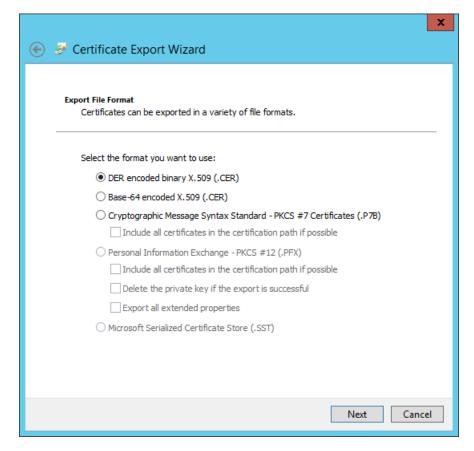

2094 2095 5. In the Certificate Export Wizard window on the Export Private Key screen, keep the selection **No, do not export the private key** and click **Next**.

20972098

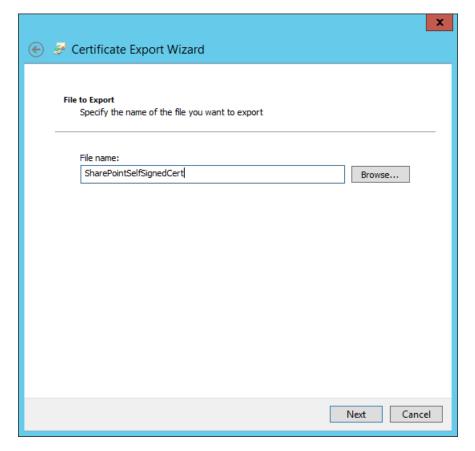

6. In the Certificate Export Wizard window on the Export File Format screen, select the format you want to use (**DER** in this example), then click **Next**.

2100

2101

7. In the Certificate Export Wizard window on the File to Export screen, type in the certificate file name and click **Next**.

2104

8. In the Certificate Export Window on the Completing the Certificate Export Wizard screen, click **Finish**.

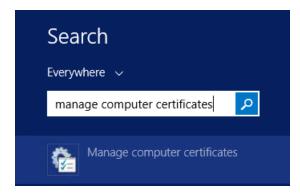

2107

9. In another Certificate Export Wizard window that automatically opens, you will see that the export was successful. Click **OK**.

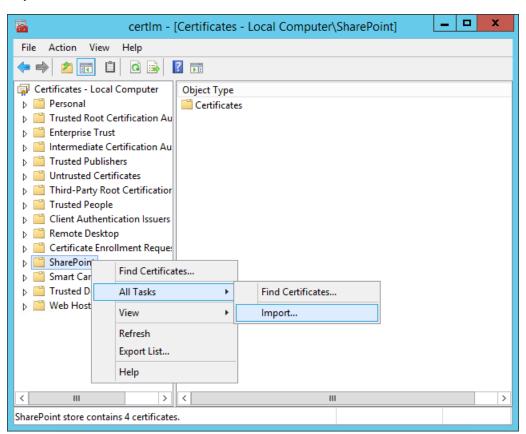

- 2109 4.4.1.3 Add the Self Signed Certificate to Trust management in Central Administration
- 2110 1. Click on the Windows icon at the bottom left corner of your screen.
- 2. Begin typing the words: manage computer certificates.
- 2112 3. Click on the Manage Computer Certificates icon.

2115

4. In the certlm window, right-click on the **SharePoint** node, hover over **All Tasks**, then click **Import**.

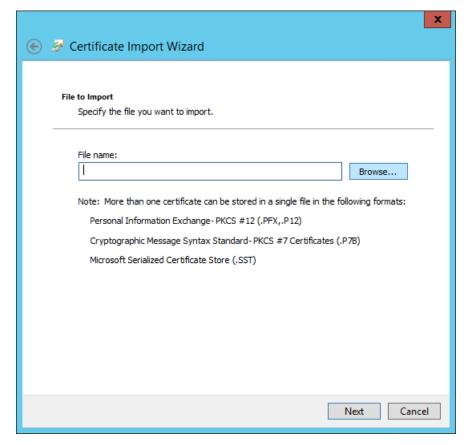

21162117

5. In the Certificate Import Wizard window that opens, click **Next**.

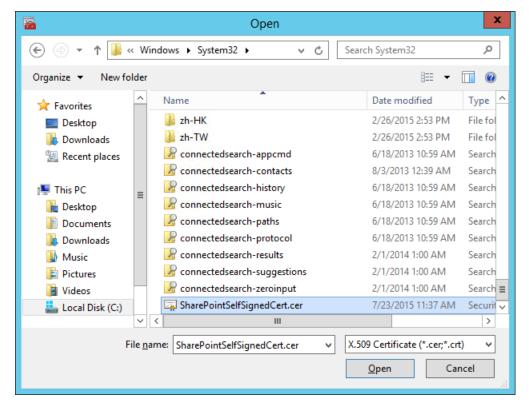

6. In the Certificate Import Wizard window, on the File to Import screen, click **Browse** to find the self-signed certificate we created in the previous sub-section.

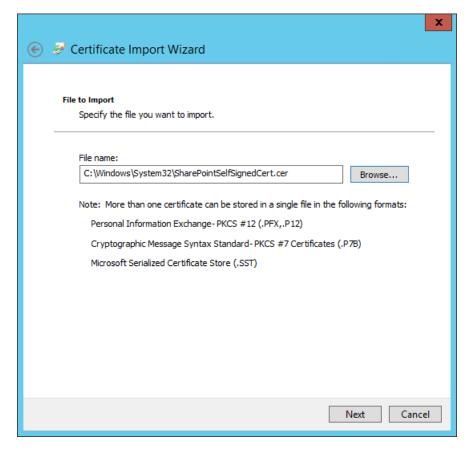

21232124

- 7. In the File Explorer window that opens automatically, click through location folders to find the self-signed certificate we created in the previous sub-section (example from this build: *C:/Windows/System32/*).
- 8. Find the certificate and click to select it; then click **Open**.

9. Back at the Certificate Import Wizard, on the File to Import screen, the location of the self-signed certificate will be in the **File name** field. Click **Next**.

2127

213021312132

10. In the Certificate Import Wizard window on the Certificate Store screen, leave the default radio button for **Place all certificates in the following store** chosen. The **Certificate store** field should be set to SharePoint. Click **Next**.

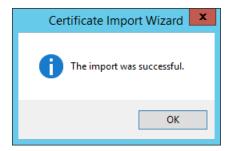

11. In the Certificate Import Wizard window, click **Finish**.

2136

2137

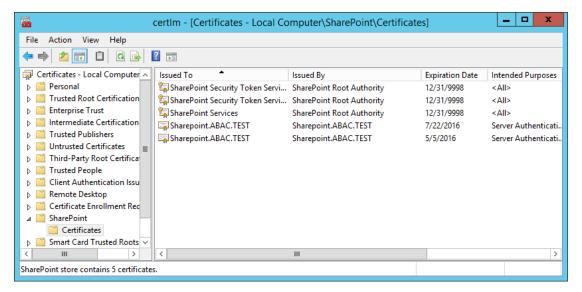

12. In the Certificate Import Wizard window that automatically opens, you will see a message that the import was successful. Click **OK**.

21382139

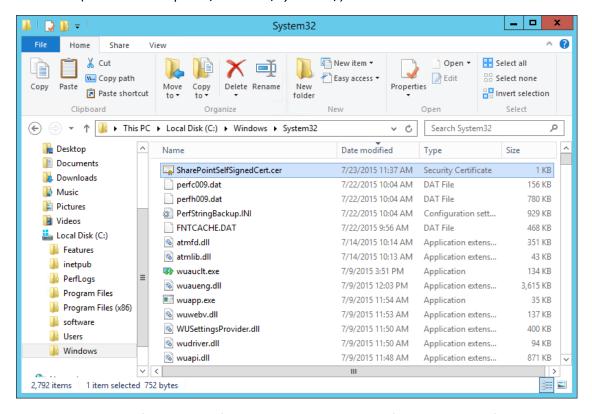

2140

13. In the certlm window, double-click on **Certificates** under the SharePoint node. The new self-signed certificate you created will be listed there.

2143

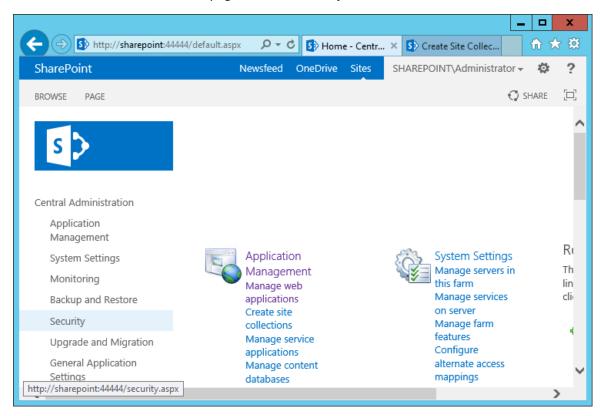

14. Open **File Explorer** and click through locations to reach the location of your self-signed certificate (from this example: *C:/Windows/System32/*).

21442145

- 15. Right-click on the **self-signed certificate** and click on **Copy** or left-click on the self-signed certificate and press the keys Ctrl+C.
- 2147 16. Right-click on your **Desktop** and click **Paste**, or left-click on your Desktop and press the keys 2148 Ctrl+V to save a copy of the certificate in an accessible location.
- 2149 17. To Manage Trust via Central Administration, do the following steps: Open a **browser**.

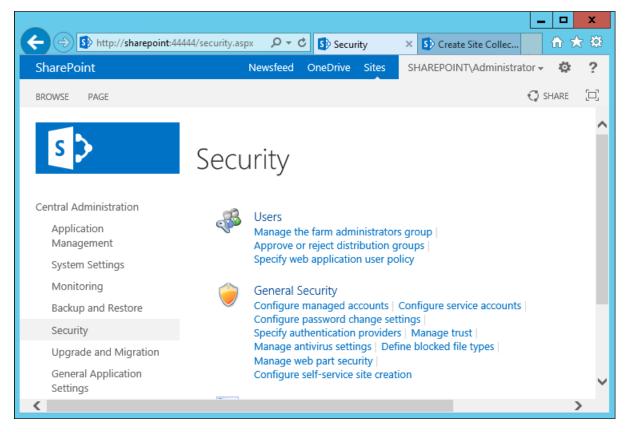

- 18. In the URL address bar of the browser, enter the address for Central Administration and click
 Enter or Go: http://sharepoint:44444/default.aspx
 - 19. From the Central Administration page, click on **Security** in the left-hand menu.

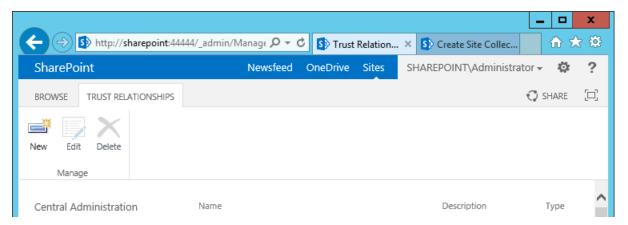

2154

2152

20. From the Security page, under the General Security section, click on Manage Trust.

21. Under the Trust Relationships tab of the Manage Trust page, click **New**.

21572158

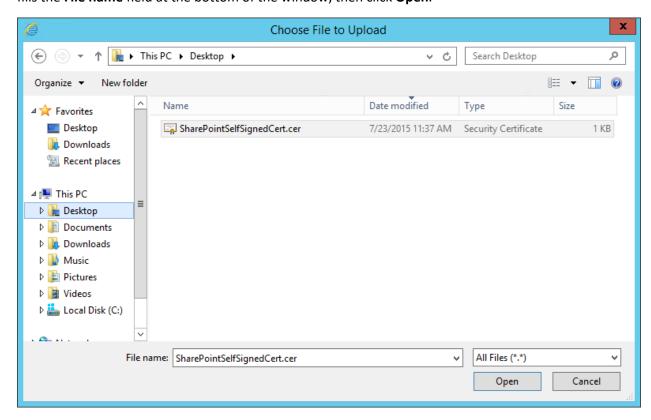

2159

2160

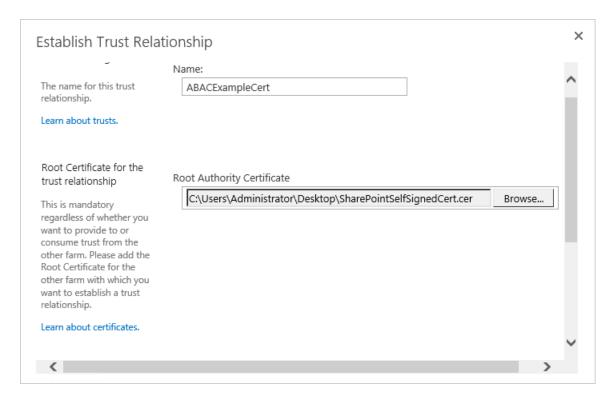

22. In the Establish Trust Relationship window that opens automatically, enter the **Name** for the trust relationship being created, then click **Browse** to find the certificate created in previous sub-sections.

23. In the Choose File to Upload window that opens automatically, navigate to the copy of your certificate from Section 4.4.1.1 (e.g., Desktop). Click on the certificate so its name automatically fills the **File name** field at the bottom of the window, then click **Open**.

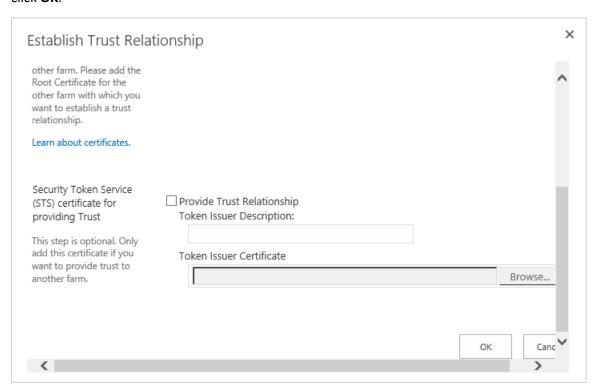

24. In the Establish Trust Relationship window, the certificate's location will be automatically entered as the **Root Authority Certificate**.

2169

2170

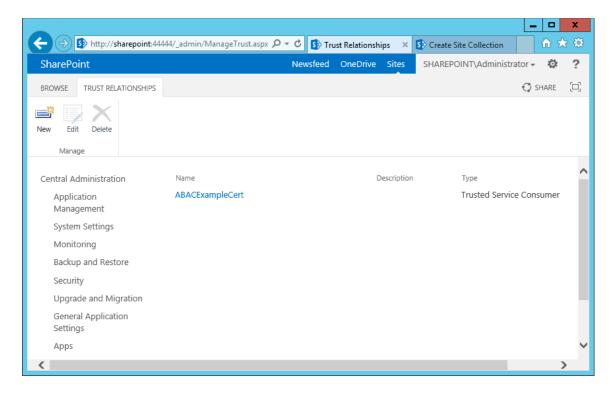

25. In the Establish Trust Relationship window, scroll down leaving the remaining fields empty, and click **OK**.

2171

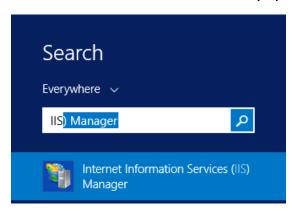

2172

26. Your new trust relationship will be listed under the Trust Relationships tab.

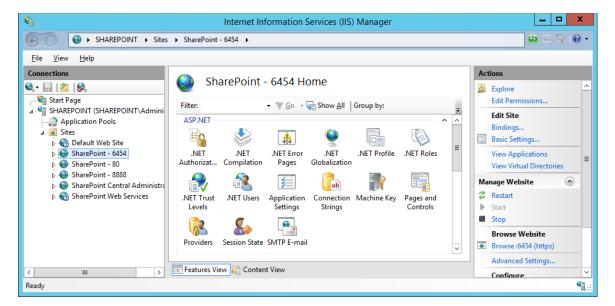

2174

- 4.4.1.4 Configure IIS Binding for the Self-Signed Certificate
- 2175 1. Click on the **Windows** icon in the bottom left corner of your screen.
- 2176 2. Begin typing IIs.
- 2177 3. When the Internet Information Services (IIS) Manager appears, click on it.

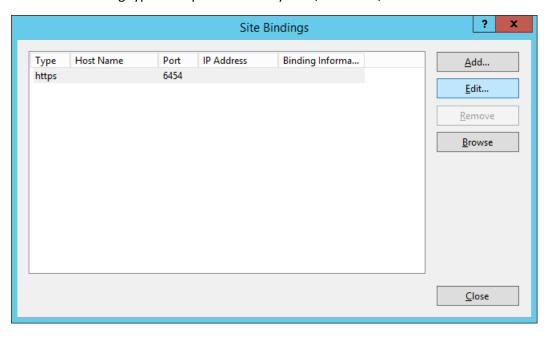

2178

4. On the left-hand side of the IIS Manager window, click on the **SharePoint web application** created in previous steps, then click **Bindings** in the Actions pane on the right.

2184

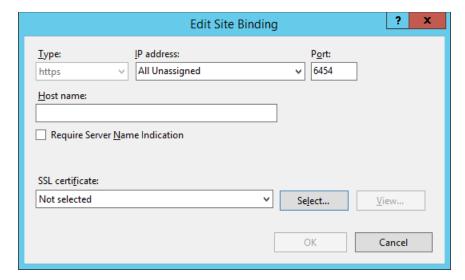

- 5. In the Site Bindings window that opens, look for a binding type of https.
- a. If a binding type of https does not exist, click on **Add**.
 - b. If a binding type of https does already exist, click on it, then click Edit.

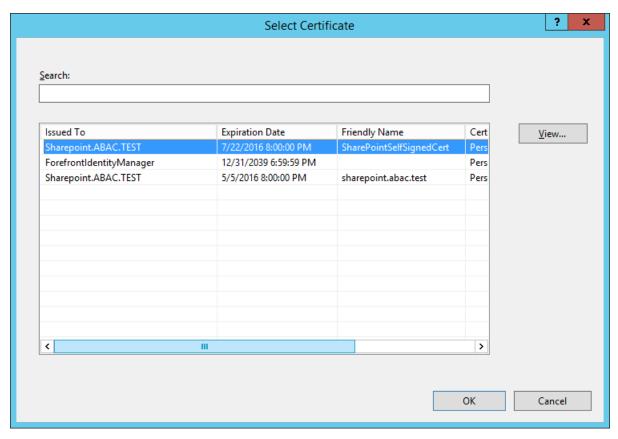

2185

2186

6. In the Edit Site Binding window next to the SSL certificate field, click **Select**.

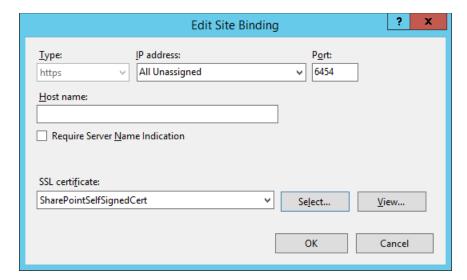

7. In the Select Certificate window, click on the certificate created in previous steps and click **OK**.

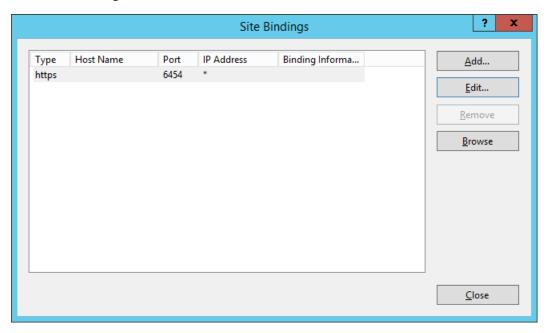

2189

2190

8. In the Edit Site Binding window, verify that your SSL certificate is listed, then click **OK**.

9. In the Site Bindings window, click **Close**.

4.4.2 Certificates Signed by Local or Online Certificate Authority

Instead of using self-signed certificates which can be used in protected lab environments, it is recommended that you use certificates signed by a Certificate Authority. For our build, we used Symantec's Managed PKI Service to sign our certificates using a local Certificate Authority. Certificates were used to support various exchanges that require encryption, such as digital signature, SAML message encryption, and encryption of TLS communications.

Although the detailed instructions of configuring certificates signed by a certificate authority vary by vendor product, the general process is described below. For each certificate, you perform the following high-level steps:

- 1. Using the vendor product (e.g., SharePoint), generate a certificate signing request on the server where you want to use the certificate. Save the signing request to a file.
 - 2. Submit an enrollment request to your certificate authority. You will need to provide the signing request that was generated in step 1. This step is typically where you provide information such as the name of the server on which you intend to use the certificate (e.g., "sharepoint.abac.test").
 - 3. A representative at the certificate authority will examine the enrollment request and approve it. The representative will issue a certificate response signed with the certificate authority's key. You can download the signed response. If you are using a certificate authority that is locally managed by your organization, you will also need to download the public key of the certificate authority because you will need to add this to the Trusted Certificate Authorities on each server and client that will be using the certificates.
 - 4. Go back to the vendor product where you created the certificate signing request. If you are using a local certificate authority, you will first need to add the certificate authority's public key to the list of Trusted Certificate Authorities.
 - 5. Import the certificate file for your server that was signed by the certificate authority.
- 2219 4.4.2.1 Generating a Certificate Signing Request (CSR)
 - 1. Log into the server where SharePoint Server 2013 is installed (e.g., SharePoint Server in our build).
 - 2. Click on the **Windows** icon in the bottom left corner of your screen.
- 2223 3. Begin typing IIs.
 - 4. When the Internet Information Services (IIS) Manager appears, click on it.

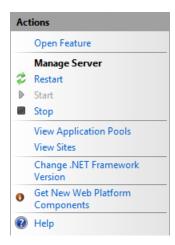

- 22252226
- 5. In the left-hand Connections column, left-click on your **SharePoint** instance.
- 2227 6. Scroll down in the SharePoint Home pane and left-click on **Server Certificates**.

2229

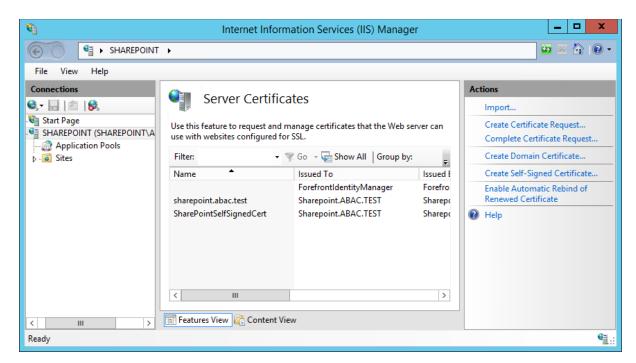

7. In the right-hand Actions column, click on **Open Feature**.

22302231

2232

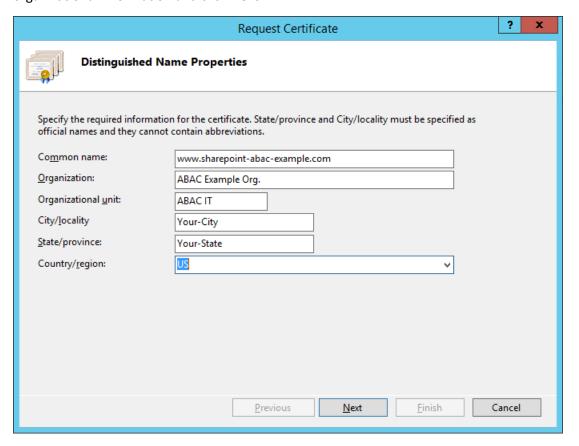

8. In the Server Certificates pane, in the right-hand Actions column, click on **Create Certificate Request**.

2234

2235

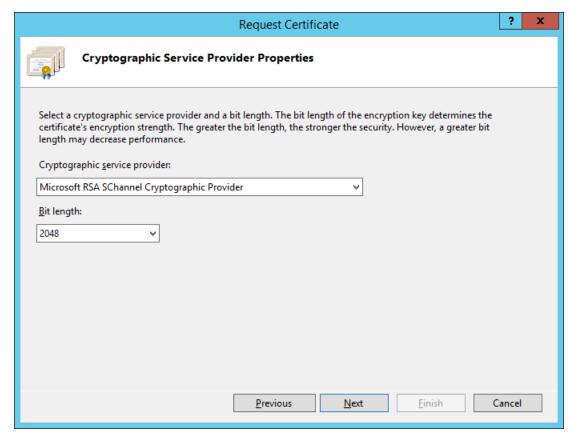

9. In the Distinguished Name Properties window that opens automatically, enter your organizational information and click **Next**.

22362237

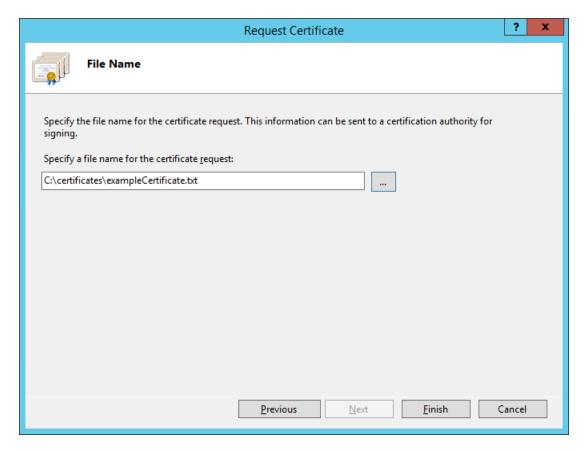

2238

10. In the Cryptographic Service Provider Properties window that opens automatically, choose the **Cryptographic service provider** and a **Bit length**, then click **Next**.

11. On the File Name screen, browse to the location where you would like to save this certificate or type in the path, including a name for your certificate ending in ".txt," then click **Finish**.

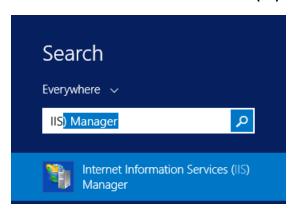

2240

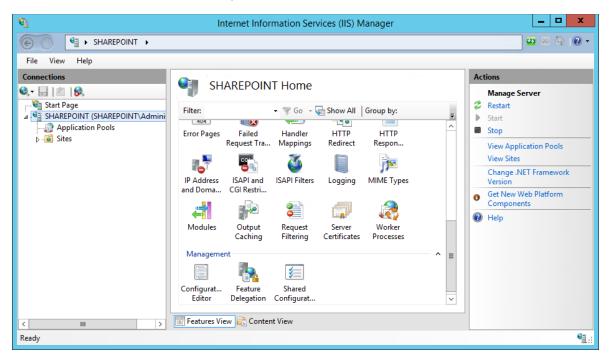

2248

2243 4.4.2.2 Installing the new signed SSL Certificate

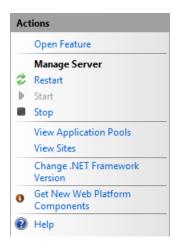

- When the new signed SSL Certificate is available either from a local or online Certificate Authority, install the certificate using the instructions in this section.
- 1. Log onto the SharePoint Server and save the SSL certificate resulting from the CSR in <u>Section</u>
 4.2.1.
 - 2. Click on the **Windows** icon in the bottom left corner of your screen.
- 3. Begin typing IIs.
- 4. When the Internet Information Services (IIS) Manager appears, click on it.

- 5. In the left-hand Connections column, left-click on your **SharePoint** instance.
- 2253 6. Scroll down in the SharePoint Home pane and left-click on **Server Certificates**.

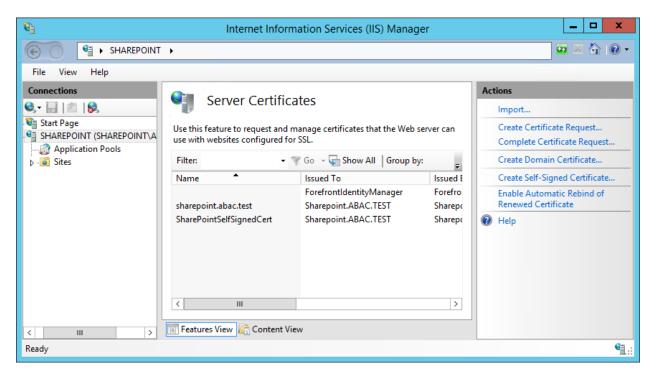

7. In the right-hand Actions column, click on **Open Feature**.

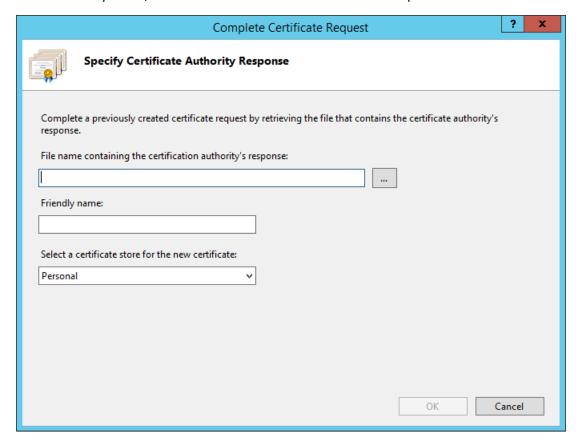

22562257

2258

8. In the Server Certificates pane, in the right-hand Actions column, click on **Complete Certificate**Request.

9. In the Complete Certificate Request wizard on the Specify Certificate Authority Response screen, browse to the location of the new SSL certificate generated from your CSR or type in its location, enter a friendly name, and choose a certificate store from the drop-down menu. Click **OK**.

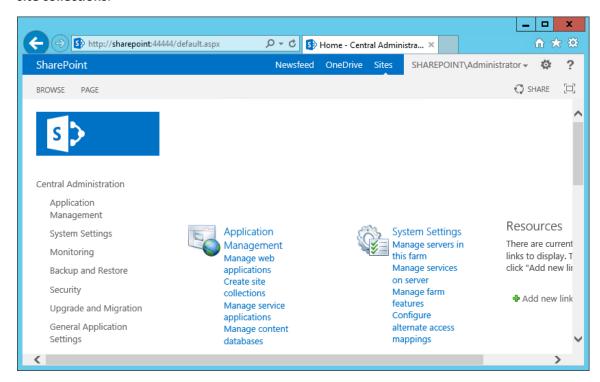

2264 4.4.2.3 Configure the CA-Signed Certificate

Follow the steps listed in <u>Section 4.4.1.4</u> to configure IIS Binding for the new SSL certificate signed by a local or online Certificate Authority. You can choose port 443 or any other available port if you prefer to use a non-standard port for SSL traffic.

2268 4.5 Creating a Site Collection

- 1. On the SharePoint Server, open a web browser.
- 2. In the **URL address bar** of the browser, enter the address for Central Administration and click Enter or Go: http://sharepoint:44444/default.aspx
- 3. From the Central Administration page, in the Application Management section, click on **Create** site collections.

22742275

2276

2277

2278

2279

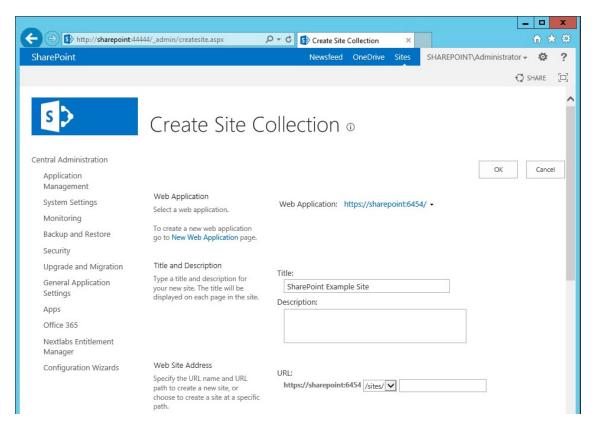

2269

2270

2271

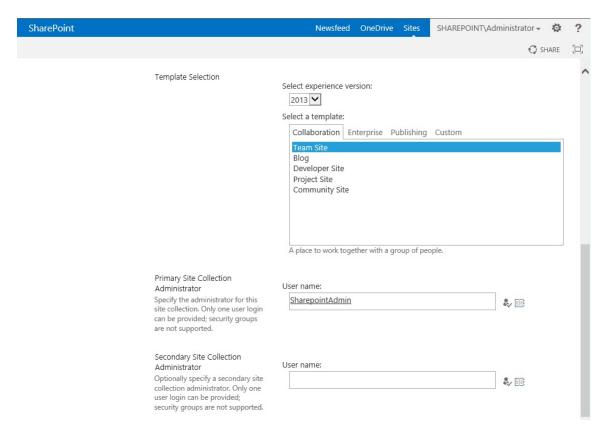

2272

- 4. On the Create Site Collection page, do the following:
 - Verify that the web application under consideration is the one chosen.
 - b. Enter a **Title** (required) and **Description** (optional).
 - c. Choose the web site address you prefer for your site (in this build, https://sharepoint:6454/).

- 22812282
- 2283
- 2284
- 2285
- 2286
- 22872288
- 2289
- 2290
- 22912292

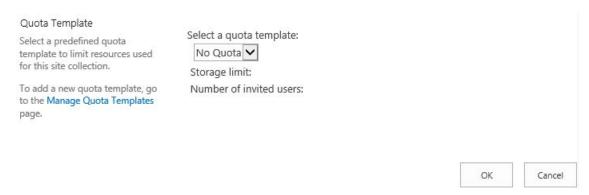

- 5. In the browser, scroll down to the Template Selection area and Primary Site Collection Administrator area of the Create Site Selection page and do the following:
 - a. Choose the **version** and **template** (e.g., 2013 Team Site)
 - b. In the **User name** field, under the Primary Site Collection Administrator area, type in the name of your SharePoint Administrator account and click on the **Name check** icon. If the name is found, it will not give a warning and the name will be underlined.
 - i. Alternatively, you can look up users by name using the address book people picker mechanism next to the user name text field.
 - c. In the **User name** field under the Primary Site Collection Administrator area, type in the name of a secondary administrator if you so choose.
 - i. Alternatively, you can look up users by name using the address book people picker mechanism next to the user name text field.

2294

2295

6. Scroll down in the browser to the Quota Template area of the Create Site Collection page. Leave the default choice **No Quota** chosen. Click **OK**.

22962297

7. Wait for the Site Collection to successfully complete.

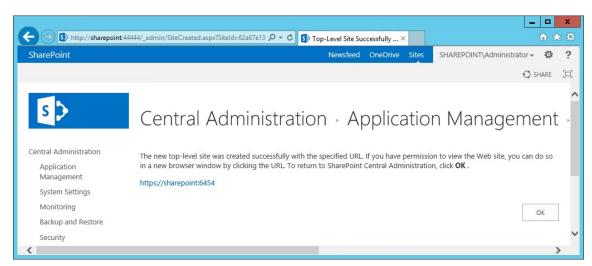

Working on it...

: This shouldn't take long.

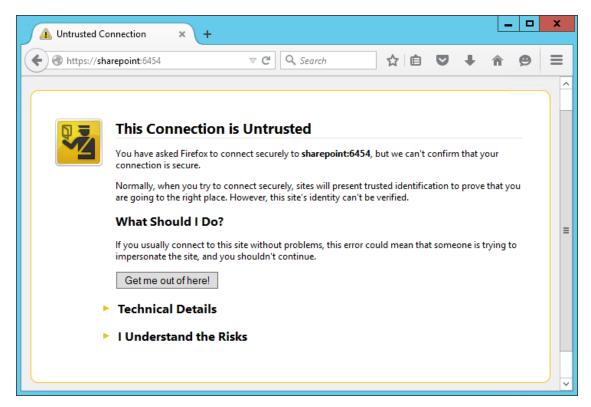

22982299

2300

8. In the browser, on the page that indicates a new top-level site was created successfully, click **OK**.

- 2302 2303
- 9. Open a browser and navigate to the URL for your new web application (e.g., https://sharepoint:6454)
- a. You may see a warning first because of the self-signing certificate.

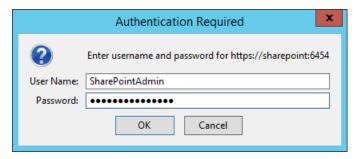

- b. In the browser window, click on I Understand the Risks, then Add Exception.
- c. In the Add Security Exception window, click on **Confirm Security Exception**.

2309

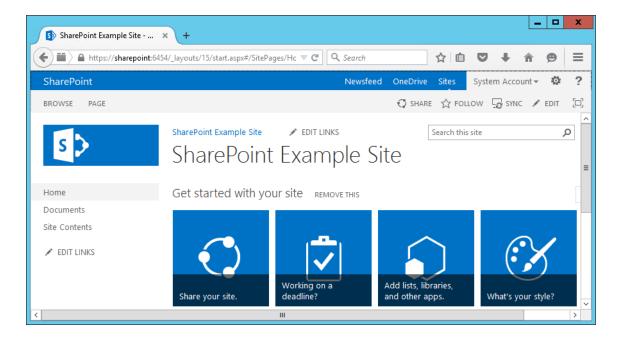

2310

10. In the Authentication Required window that opens automatically, enter the administrator account **User Name** and **Password**, then click **OK**.

23112312

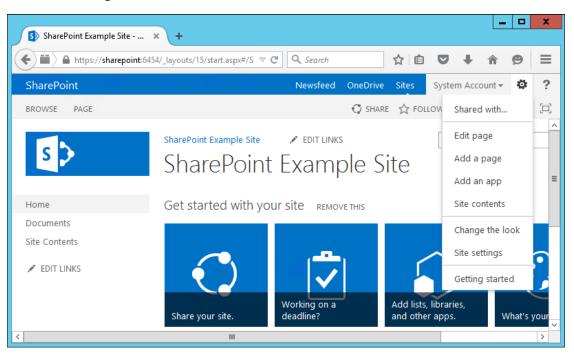

11. Upon verification that the login was a success, you will see default site contents.

2314

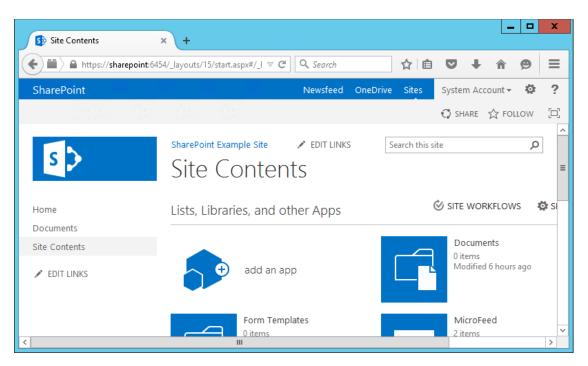

4.6 Creating New Sub-Sites

2315 1. After logging into your site, in your browser window click the **gear symbol** next to the Administrator login area, then click on **Site Contents**.

23172318

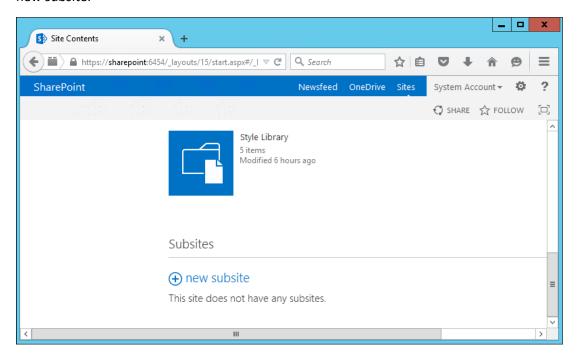

2. In the browser window, the Site Contents page will open.

2320

2321

3. In the browser window, scroll down to the Subsites area and click the **plus sign button** next to new subsite.

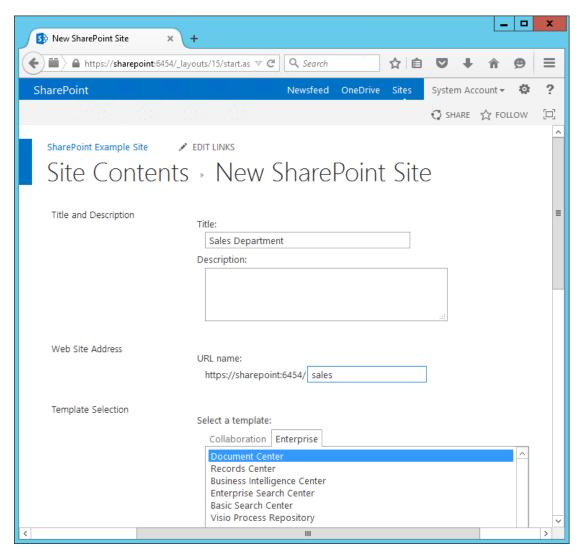

2322

2323

2325

- 4. In the browser window on the New SharePoint Site screen, do the following:
- a. Enter **Title** (required) and **Description** (optional).
 - b. Enter a **URL name**.
 - c. Select a template.

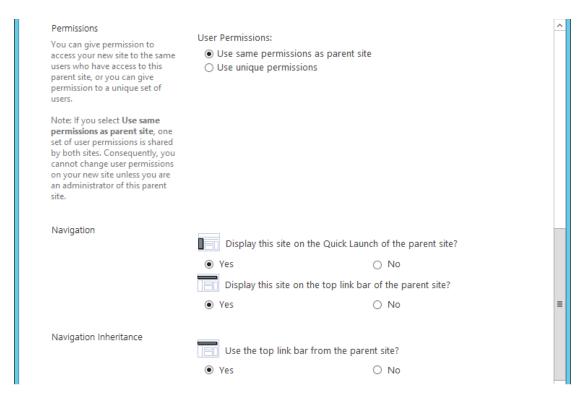

2328

5. In your browser, scroll down and do the following:

2329 2330 a. Choose **User Permissions** (in our build, we left the Use same permissions as parent site radio button selected).

2331

b. Choose your **Navigation** and **Navigation Inheritance** settings.

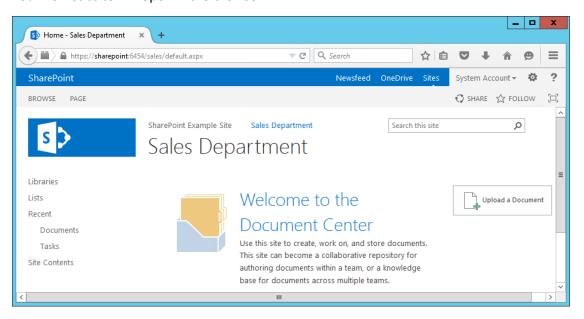

2333 6. In the browser, scroll down and click **Create**.

23342335

7. Your new subsite will open in the browser.

2340

2337 8. Return to the homepage URL https://sharepoint:6454 and repeat the steps from Section 4.6 to create other subsites of interest.

5 Set Up Federated Authentication at the Relying Party's SharePoint

2341 5.1 Introduction

- In previous sections of this How-To Guide we demonstrated how to set up set up federated authentication between the relying party and the identity provider and how to create the relying party's SharePoint site. In this section, we demonstrate how to set up federated authentication between the relying party's SharePoint and the PingFederate-RP. Before continuing with this section implementers are required to have federation servers at both the identity provider and the relying party as well as a working SharePoint instance that is claims-aware. For this build we provide instructions for setting up
- 2348 these components in Section 2, Section 3, and Section 4.
- 2349 We will demonstrate how to set up a trusted logon provider for the relying party' so that when a user
- 2350 requests access to a SharePoint site, the user will be redirected to the PingFederate-RP for
- authentication via WS-Federation. The Ping-Federate-RP will then forward the authentication request to
- 2352 the PingFederate-IdP. The PingFederate-IdP will present a logon page to the user. Once the user
- authenticates, the user will be redirected back to the original SharePoint site and will be able to access
- the site because they have a valid authentication token.
- 2355 As you complete different steps in this section you will be able to verify the correctness or completeness
- 2356 of your component configuration and integration in Functional Test sub-sections.
- 2357 If you follow the instructions in this How-To Guide section, you will be able to perform a Functional Test
- 2358 to verify the successful completion of the steps for installing, configuring, and integrating the
- 2359 components.

5.2 Usage Notes on PingFederate

- When using the PingFederate application to perform an administrative configuration, there is usually a sequence of screens, ending with a summary page. Once you click **Done** on the summary page, you must also click **Save** on the following page to save the configurations. If you forget to click **Save**, you may inadvertently lose changes to the configuration.
- Ping identity refers to the relying party as the **Service Provider** in their PingFederate product and associated documentation.
- When using the PingFederate application to perform configuration, refer to the title of the tab with a small star icon to its left, to easily identify the item you are currently configuring. For example, if you navigated to the following screen, you would be on the IdP Adapter screen.

♠ Main		Manage IdP Adapter Instances			•	Create Adapter Instance
Туре	pe ☆ IdP Adapter		Extended Contract	Adapter Attributes	Summary	

2360

2361

2362

2363

2364

2365

23662367

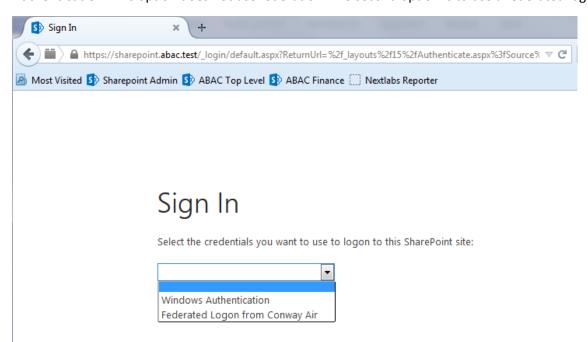

2368

2371 5.3 Configure a SharePoint Federated Logon Provider

Follow the instructions in this section to configure the federated logon provider at the relying party's
SharePoint site. Once this configuration is complete, the user will see two authentication options when

first attempting to access the SharePoint site. The first option is to log on using the default Windows

2375 **Authentication**. This option does not use federation. The second option is to use a federated logon.

2376

2377

2378

2379

2380

2381

2382

2384

2385

2386

2387

23882389

2390

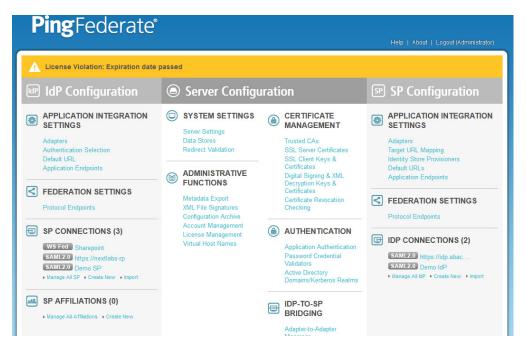

2374

In order to set up a federated logon, you will configure a trust relationship between the SharePoint server and the PingFederate-RP that will facilitate the federated logon. Once a user authenticates via a federated logon, the PingFederate-RP will cryptographically sign WS-Federation messages and send them to the SharePoint server. The PingFederate-RP must be configured as a trusted identity token Issuer in SharePoint, so that SharePoint will accept the messages sent by the PingFederate-RP and allow the user access to the SharePoint site.

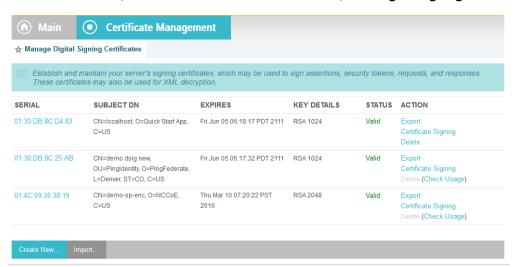

2383 5.3.1 Setting up the Certificate

Setting up a certificate involves creating the certificate at the from the identity provider, exporting the certificate, and importing it in the SharePoint site of the relying party.

- 1. Logon to the server that hosts the PingFederate service for the relying party.
- 2. Launch your browser and go to: https://<DNS_NAME>:9999/pingfederate/app.
- 3. Replace **DNS_NAME** with the fully qualified name of the relying party's PingFederate server (e.g., https://rp.abac.test:9999/pingfederate/app).
- 4. Logon to the PingFederate application using the credentials you configured during installation.

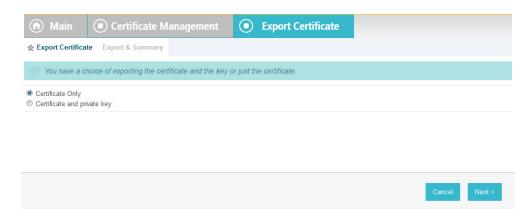

5. On the Main Menu, under **CERTIFICATE MANAGEMENT**, click **Digital Signing and XML**.

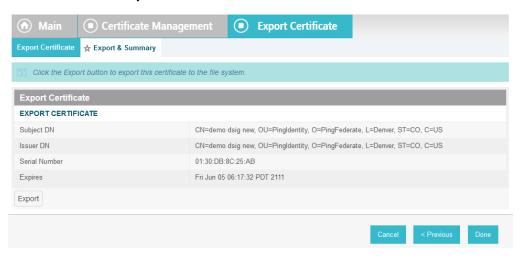

23932394

23952396

 Locate the certificate that will be used to sign messages that will be sent to the SharePoint server. In the example screenshot above, this certificate has CN with the value **demo dsig new**.
 Click on the **Export** link for this certificate in the **ACTION** column.

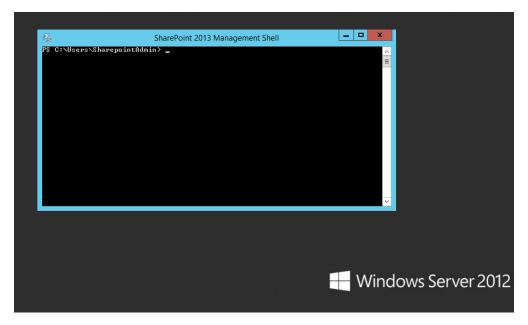

7. Select **Certificate Only** and click **Next**.

2399

- 8. On the Export & Summary page, click the **Export** button on the left side of the page. Save the file to the hard drive and rename it to **federation.cer**.
- 9. Using the SharePoint administrator credentials, logon to the server that hosts SharePoint for the relying party.
- 10. Copy the **federation.cer** file to the desktop on the SharePoint server.
- 2405 11. Click on the **Start** menu and navigate to the SharePoint 2013 Products group. Open the SharePoint 2013 Management Shell.

24092410

2411

12. To verify that you placed the federation.cer file to the desktop, enter the following command into the Management Shell (using the correct path for your server).

dir c:\users\SharePointadmin\desktop\federation.cer

You should see information about the file such as the LastWriteTime.

24122413

24142415

2416

2417

2418

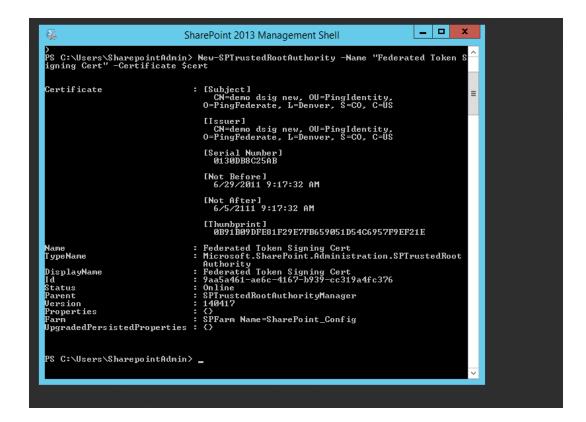

2419

13. Enter the following commands into the Management Shell to import the PingFederate-RP's signing certificate (using the correct path for your server):

\$cert = New-Object System.Security.Cryptography.X509Certificates.X509Certificate2("C:\forall users\forall SharePointadmin\forall Desktop\forall federation.cer")

New-SPTrustedRootAuthority -Name "Federated Token Signing Cert" -Certificate \$cert

SharePoint responds by displaying details about the imported certificate.

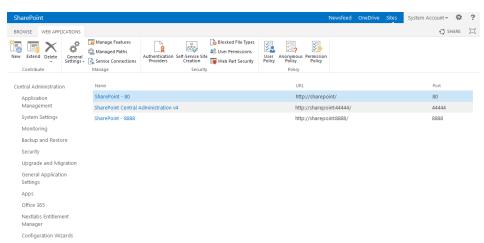

5.3.2 Configuring the Trusted Identity Token Issuer

To configure a new Trusted Identity Token Issuer, enter each of the commands displayed below the next paragraph into the Management Shell to configure a new Trusted Identity Token Issuer. Enter each command separately, and enter a Carriage Return after the command. If the command executed successfully, Management Shell will not provide any feedback. If an error occurs, Management Shell will display the error.

In the example commands below, the attribute **upn** is configured. You can replace **upn** with an attribute that is appropriate for your environment. The realm value (e.g., **urn:SharePoint.abac.test**) must be identical to the realm value configured in the relying party's PingFederate Service Provider (SP) connection that will be configured later in this section. The signInURL should be configured with the PingFederate-RP WS-Federation URL (e.g., *https://rp.abac.test:9031/idp/prp.wsf*). In this example, the name given to this new token issuer in SharePoint is **Federated Logon from Identity Provider**. The issuer name will be displayed in SharePoint administration screens and to the end user on the Sign On screen.

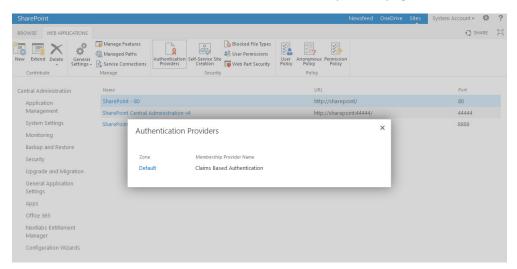

```
2434
              $claimmap = New-SPClaimTypeMapping -IncomingClaimType "http://sche-
2435
              mas.xmlsoap.org/ws/2005/05/identity/claims/upn" -IncomingClaimTypeDisplayName
2436
              "upn" -SameAsIncoming
2437
              $realm = "urn:SharePoint.abac.test"
2438
              $signInURL = https://rp.abac.test:9031/idp/prp.wsf
2439
              $ap = New-SPTrustedIdentityTokenIssuer -Name "Federated Logon from Identity
2440
              Provider" -Description "Federated Logon" -realm $realm -ImportTrustCertificate
2441
              $cert -ClaimsMappings $claimmap -SignInUrl $signInURL -IdentifierClaim $claim-
2442
              map.InputClaimType
```

- 2443 5.3.3 Configuring the Token Issuer as a Sign On Option
- After configuring the new Trusted Identity Token Issuer, configure the new token issuer as a Sign On option for the SharePoint site.
- 1. Launch your browser and go the SharePoint central administration page (e.g., http://SharePoint.abac.test:44444/default.aspx).
 - 2. Logon using the credentials of the SharePoint administrator
- 2449 3. In the Application Management group, click on Manage web applications.
- Click on the web application that contains the SharePoint site you are managing (e.g.,
 SharePoint 80). SharePoint will highlight the web application row that you clicked on.

2448

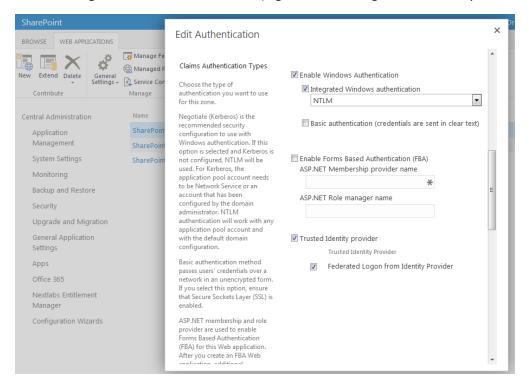

5. Click on the **Authentication Providers** button at the top of the page.

2454

- 6. Click on the **Default** link in the **Zone** column.
- 7. On the Edit Authentication screen, scroll down to the **Claims Authentication Types** group. Select the **Trusted Identity provider** option.

2458 8. Under the **Trusted Identity provider** checkbox, select the name of the new token issuer that was created using the Powershell commands (e.g., Federated Logon from Identity Provider).

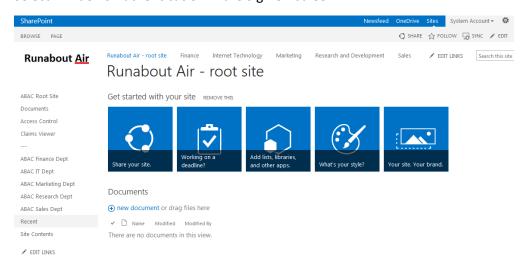

24602461

2465

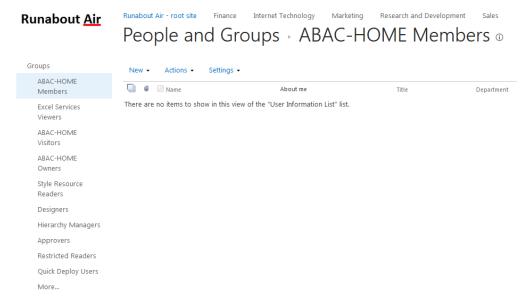

2466

2467

- 9. Scroll to the bottom of the page and click **Save**.
- 2462 5.3.4 Configuring the Access Control Rule on SharePoint
- After configuring the token issuer as a Sign On option for SharePoint, configure the access control rule on the SharePoint site that is necessary for federated users to be able to access the site.
 - 1. Logon to the relying party's SharePoint site (e.g., https://SharePoint.abac.test) using the credentials of the SharePoint administrator.
 - 2. Select **Windows Authentication** in the Sign On screen.

- 2469 3. Click the gear icon at the top right corner of the page and select the **Site Settings** link.
- 4. On the Site Settings screen, in the **Users and Permissions** group, click **People and Groups**.
- 2471 5. Under the **Groups** heading on the left pane, click on the **HOME Members** group.

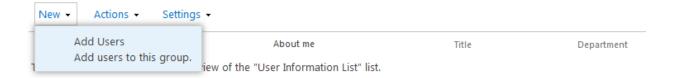

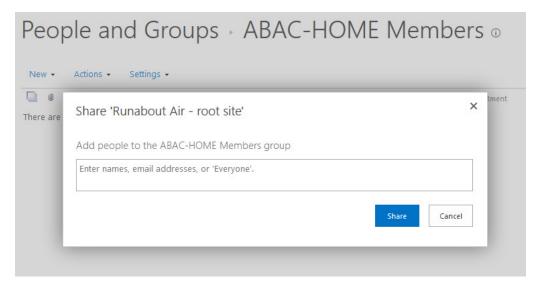

2473

2474

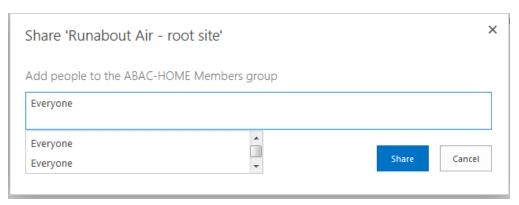

6. Under the page title, click on the **New** link and select the **Add Users** option from the popup menu.

People and Groups ABAC-HOME Members ①

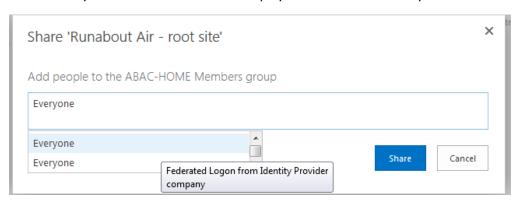

- 7. On the Share popup screen, enter **Everyone** in the text field.
- 2478 SharePoint will display a List Box underneath the text field.

24792480

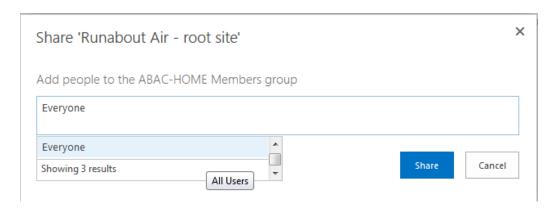

2481

The list will contain multiple entries for the same value of **Everyone**. If you place your cursor over an entry in the list SharePoint will display details about the entry.

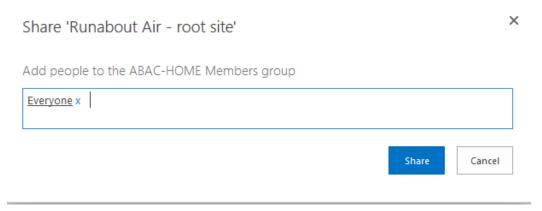

24822483

8. Locate the entry that is associated with **All Users**.

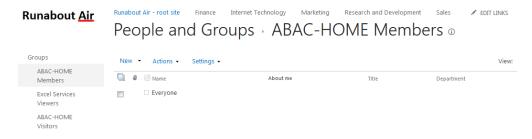

9. Click on the entry associated with All Users.

24862487

- 10. Click Share.
- When you go back to the People and Groups screen, you should see **Everyone** listed for the Home Members group.

2490

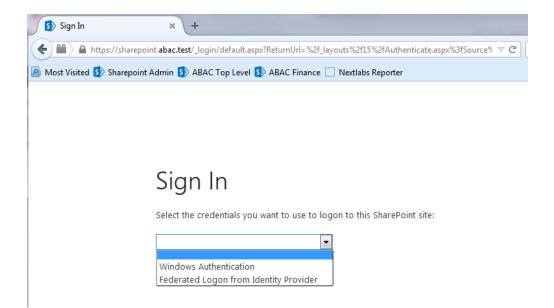

2491

24922493

2494

2495

- 5.3.5 Functional Test of the Federated Logon at the Resource Provider
- 1. Launch a new browser window and go to the relying party's SharePoint site (e.g., https://SharePoint.abac.test).
 - <u>Expected Result</u>: You should see two logon options in the dropdown box. One of the options should be the name of the new trusted token issuer that was configured in the previous section (e.g., Federated Logon from Identity Provider).

2499

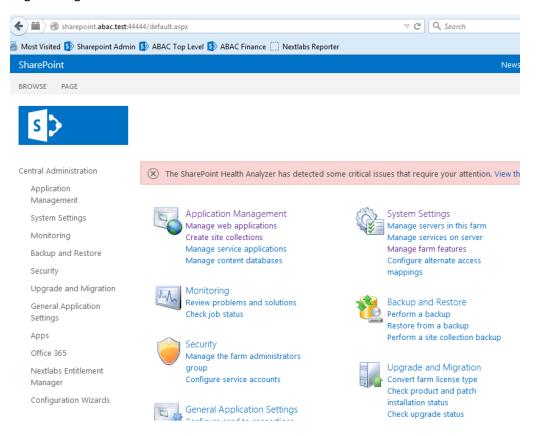

2500

2501

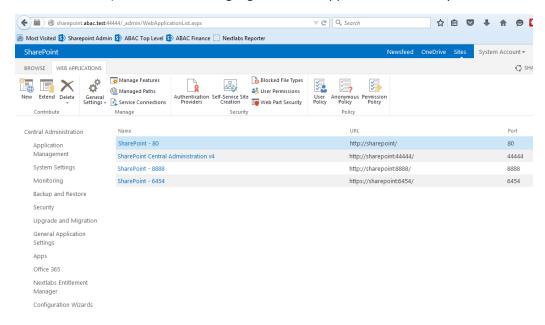

2502

2498 Next you will verify that SharePoint is configured to read the upn attribute that was configured for the federated logon.

- 2. Launch your browser and go the SharePoint central administration page (e.g., http://SharePoint.abac.test:44444/default.aspx).
 - 3. Logon using the credentials of the SharePoint administrator.

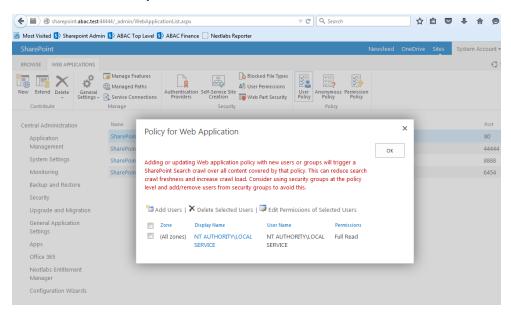

- 4. In the **Application Management** group, click on **Manage web applications**.
 - 5. Click on the web application that contains the SharePoint site you are managing (e.g., SharePoint 80). SharePoint will highlight the web application row that you clicked on.

2505

2506

2508 6. Click on the **User Policy** button.

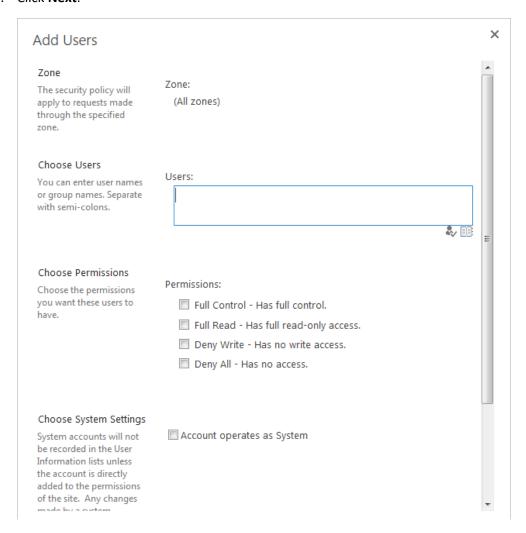

2509

2510

Click Add Users.

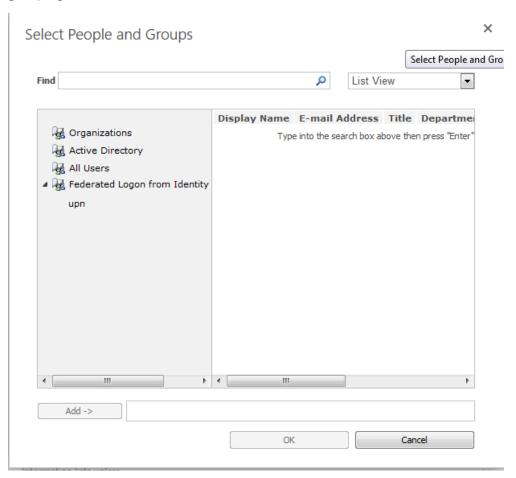

2512 8. Click **Next**.

- 9. On the Add Users screen, click the small browse icon (looks like a book) under the Users field.
- Expected Result: On the Select People and Groups screen, you should see a grouping with the name of the trusted token issuer that was configured via Powershell (e.g., **Federated**

Logon from Identity Provider). You should also see the upn attribute listed under thatgrouping.

2519

2520

2521

2522

2523

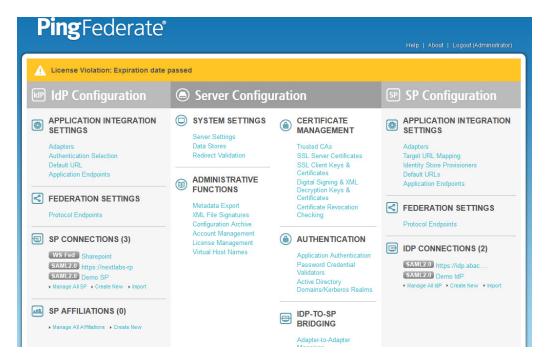

2524

2525

25262527

5.4 Configure the PingFederate-RP Connection to SharePoint

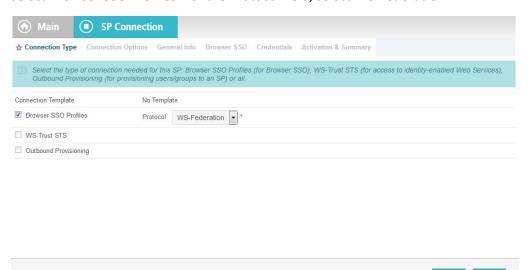

- Follow the instructions below to configure a PingFederate connection from the PingFederate-RP to the relying party's SharePoint.
 - 1. Logon to the server that hosts the PingFederate service for the relying party.
 - 2. Launch your browser and go to: https://<DNS_NAME>:9999/pingfederate/app. Replace DNS_NAME with the fully qualified name of the relying party's PingFederate server (e.g., https://rp.abac.test:9999/pingfederate/app). Logon to the PingFederate application using the credentials you configured during installation.

2529

2530

3. On the **Main Menu** under SP CONNECTIONS, click **Create New**. On the Connection Type screen, select **Browser SSO Profiles**. For the Protocol field, select **WS-Federation**.

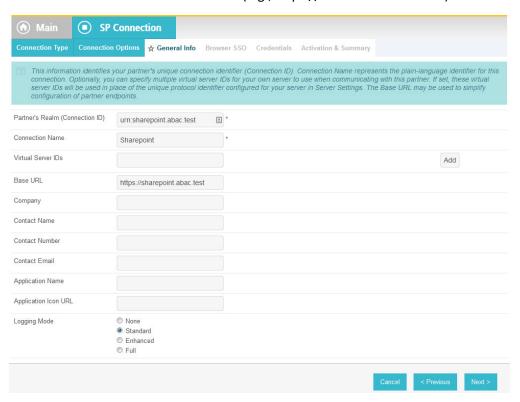

25312532

4. Click **Next**. On the Connection Options screen, select **Browser SSO**.

 5. Click **Next**. On the General Info screen, for the Partner's Realm field, enter the name of the Resource Provider's (SharePoint) realm (e.g., urn:SharePoint.abac.test). Keep a copy of the realm name because it will be used in a configuration of SharePoint later in the guide.

6. Enter a unique name for this new PingFederate configuration in the Connection Name field. For the Base URL field, enter the root destination URL at the SharePoint site where the PingFederate will redirect a user once authenticated (e.g., https://SharePoint.abac.test).

7. Click Next.

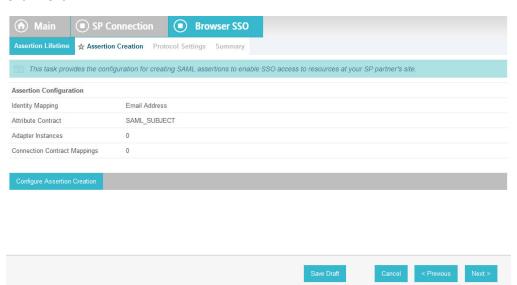

2544

8. On the Browser SSO screen, click **Configure Browser SSO**. On the Assertion Lifetime screen, enter a value of 20 for the Minutes After field.

2545

2546 9. Click **Next**.

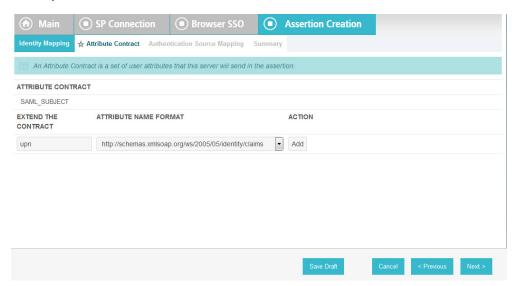

2548 10. On the Assertion Creation screen, click Configure Assertion Creation. On the Identity Mapping
 screen, select User Principal Name.

2550

255125522553

11. Click **Next**. On the Attribute Contract screen, below the EXTEND THE CONTRACT FIELD, enter "upn" in the textbox. For the ATTRIBUTE NAME FORMAT select the **schemas.xmlsoap.org 2005** identity claims format.

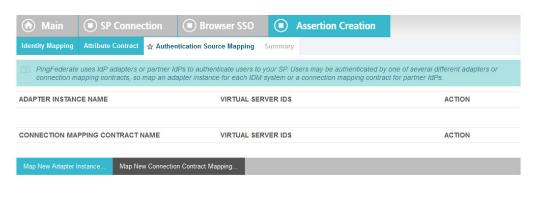

2554

2555 12. Click Add.

2556

2557 13. Click **Next**.

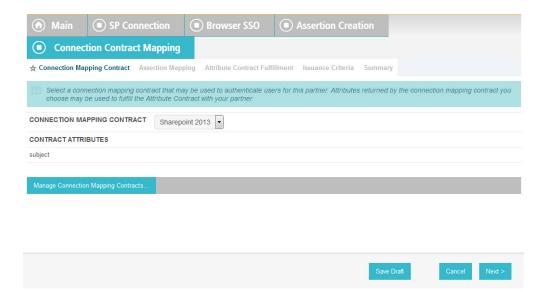

2558

2559

2560

25612562

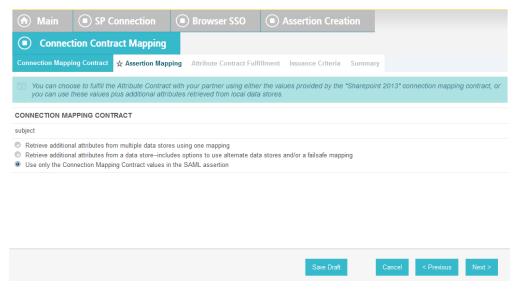

14. On the Authentication Source Mapping screen, click **Map New Connection Contract Mapping**. On the Connection Contract Mapping screen, for the CONNECTION MAPPING CONTRACT field, select the name of the contract with the identity provider that was configured in a <u>Section 3</u> (e.g., SharePoint 2013).

25632564

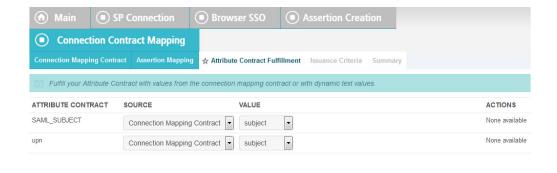

2565

15. Click **Next**. On the Assertion Mapping screen, select **Use only the Connection Mapping Contract** values in the **SAML** assertion.

2566

2567 16. Click **Next**.

2568

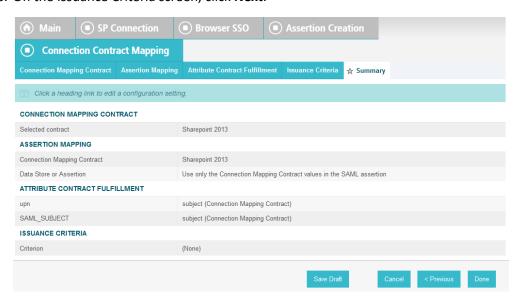

2569

17. On the Attribute Contract Fulfillment screen, click Next.

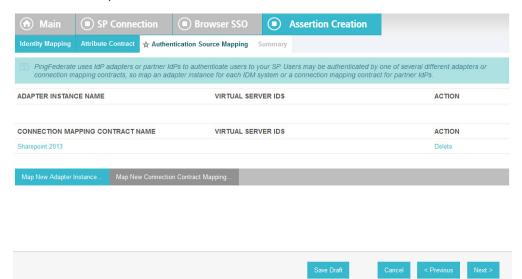

25702571

18. On the Issuance Criteria screen, click **Next**.

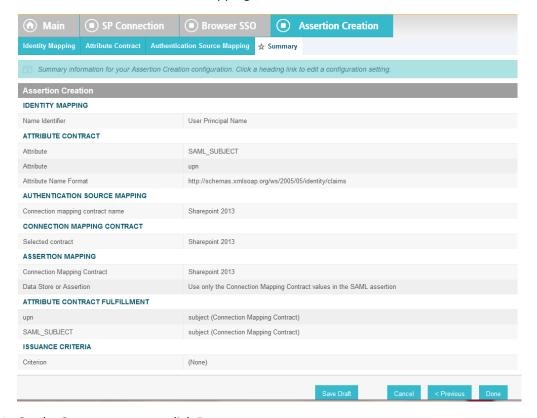

2573 19. On the Summary screen, click **Next**.

2574

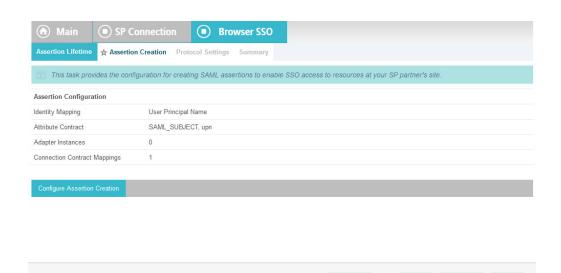

2575 20. On the Authentication Source Mapping screen, click **Next**.

2576

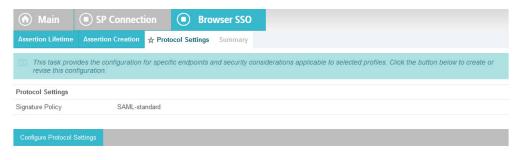

2577

21. On the Summary screen, click **Done**.

2579

22. On the Assertion Creation screen, click Next.

2584

25852586

2587

2588

2591

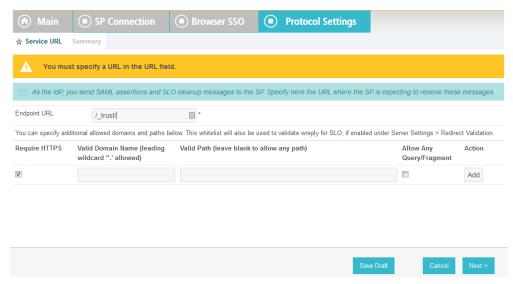

23. On the Protocol Settings screen, click **Configure Protocol Settings**. On the Service URL screen, for the Endpoint URL field, enter the name of the destination URL at the Service Provider (SharePoint) site (.e.g., /_trust/). When PingFederate completes the authentication process, the user will be sent to a destination URL. The destination URL is a combination of two configuration fields. The first is the Base URL that was configured earlier, and the second is the Endpoint URL on this screen. The Endpoint URL will be appended to the Base URL. An example is provided below.

Base URL: https://SharePoint.abac.test/_trust/

2589 Endpoint URL: / trust/

2590 After authentication, PingFederate will redirect to the destination:

https://SharePoint.abac.test/_trust/

2593 24. Click **Next**.

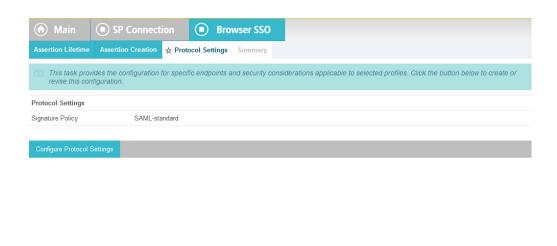

2592

25942595

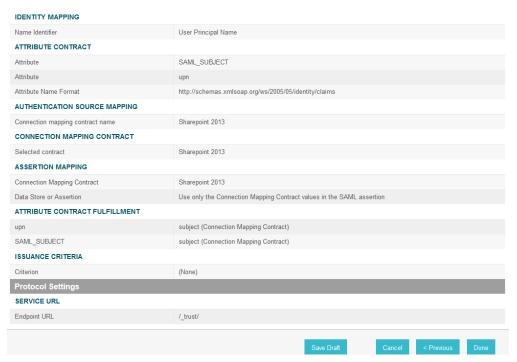

Save Draft Cancel < Previous Done

25. On the Summary screen, click **Done**.

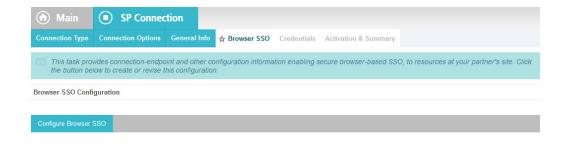

2596

2597 26. On the Protocol Settings screen, click **Next**.

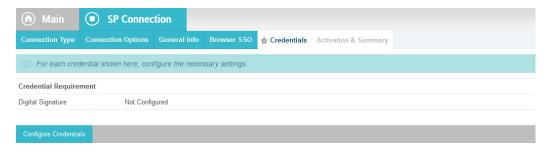

25982599

27. On the Summary screen, click **Done**.

2600 2601

28. On the Browser SSO screen, click Next.

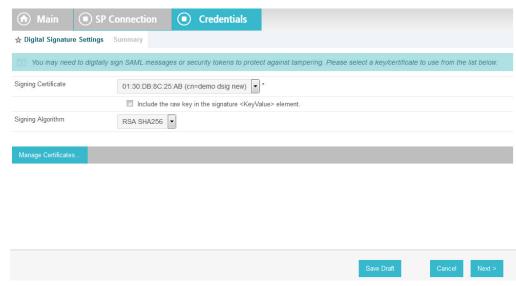

26022603

2604

29. On the Credentials screen, click **Configure Credentials**. On the Digital Signature Settings screen, select the **Signing Certificate for SAML messages**.

Save Draft

2605260630

30. Click Next.

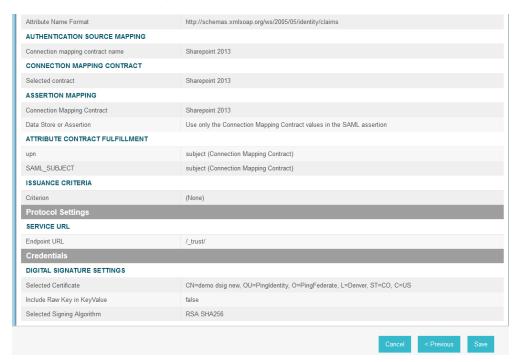

26072608

31. On the Summary screen, click **Done**.

26092610

32. On the Credentials screen, click Next.

26112612

2613

On the Activation and Summary screen, select **Active** for the Connection Status field and Click **Save** to complete the configuration.

2614 5.5 Functional Test of All Configurations for Section 5

- The instructions in this section will perform an integrated test all of the configurations in Section 5.

 Using the browser, you will logon using an account that was created in Active Directory and validate that the complete federated authentication flow between SharePoint and the PingFederate servers at the relying party and identity provider operates successfully.
- Launch your Firebox browser and select SAML tracer from the Tools menu.
 This will launch an empty SAML tracer window. Minimize the SAML tracer window. The SAML tracer will automatically record the details of the HTTPS messages in the background.
 - 2. Go back to the main browser window and go to the relying party's SharePoint site (e.g., https://SharePoint.abac.test).

Sign In Select the credentials you want to use to logon to this SharePoint site: Windows Authentication

2624

2625

2626

2627

2628

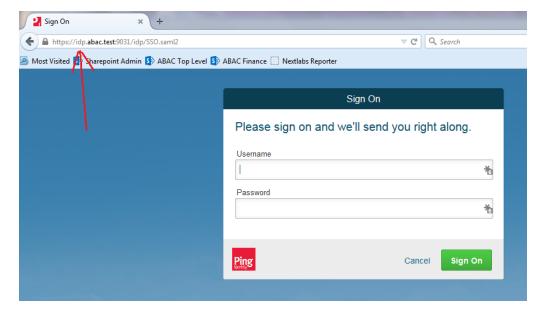

2629

2622

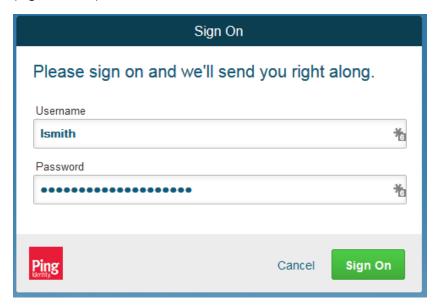

2623

3. Select the option to use the new trusted token issuer (e.g., Federated Logon from Identity Provider) that was configured in this section.

<u>Expected Result</u>: Your browser should be redirected to the PingFederate-IdP and you should see the PingFederate Sign On screen. Examine the server name in the URL to ensure that it is the identity provider's PingFederate server (e.g., idp.abac.test).

4. Enter the Username and Password of the Active Directory account created earlier in this guide (e.g., "Ismith").

5. Click **Sign On**. On the RSA Adaptive Authentication screen, enter the SMS validation code received on your mobile phone. Click **Next**.

Note: Once authenticated at the identity provider, your browser should automatically redirect to the PingFederate-RP (e.g., rp.abac.test) and then to the relying party's SharePoint (SharePoint.abac.test) site. Depending on the processing time of the servers in your environment, and other factors, it may take several seconds before your browser arrives back at the SharePoint site. The identity provider will redirect your browser to the PingFederate-RP first, and then the PingFederate-RP will redirect your browser to the SharePoint site, however you may not notice all of this activity if it happens quickly.

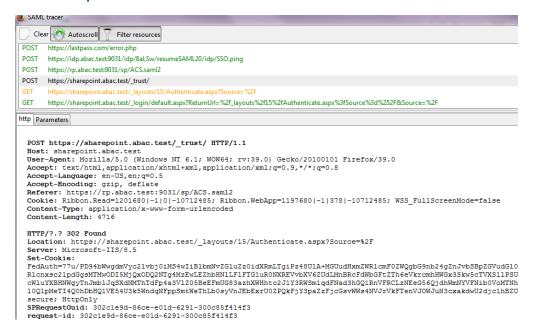

2643 Expected Result: Go back to the SAML tracer window. Scroll down the list of messages at the top
2644 and ensure there is a POST message to the SharePoint server to the _trust URL (e.g., POST
2645 https://SharePoint.abac.test/_trust/).

26462647

2648

6. Click on the POST message to the SharePoint _trust URL to bring up the details of the message in the bottom pane.

2649

2650

7. Click on the Parameters tab for the bottom pane.

```
| Maps//Marapoint.absc.test/_Injust/15/Adhericals.app?Gource %3F | Maps//Marapoint.absc.test/_Injust/15/Adhericals.app?Gource %3F | Maps//Marapoint.absc.test/_Injust/15/Adhericals.app?Gource %3F | Maps//Marapoint.absc.test/_Injust/Adhericals.app?Gource %3F | Maps//Marapoint.absc.test/_Injust/Adhericals.app?Gource %3F | Maps//Marapoint.absc.test/_Injust/Adhericals.app?Gource %3F | Maps//Marapoint.absc.test/_Injust/Adhericals.app?Gource %3F | Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps//Maps/
```

2651

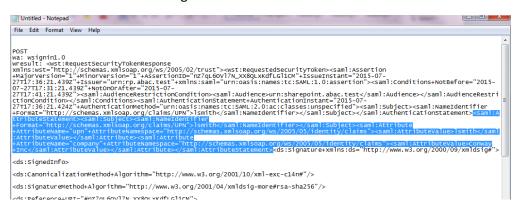

2652

2653

8. Copy all of the content (beginning with the POST line) in the bottom page and paste it into a text editor such as Notepad. Turn on Word Wrap to make it easier to see all of the XML content.

9. Scroll down the SAML message and locate the AttributeStatement node and sub-nodes.

2656 2657

2658

2659

10. For the AttributeStatement node and sub-nodes, enter some carriage returns before each XML tag to make it easier to examine the data. The goal is to be able to easily examine the Attribute nodes within the AttributeStatement node.

```

```

2660

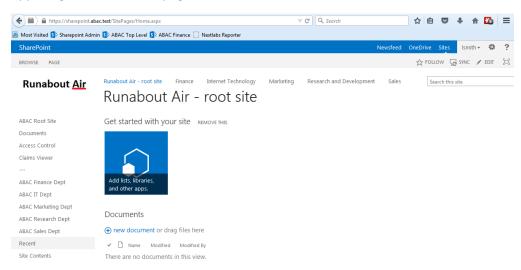

2661 Expected Result: Within the AttributeStatement node, there should be an Attribute sub-node. The Attribute sub-node should have an AttributeName value of "upn". The AttributeNamespace 2662 value should be http://schemas.xmlsoap.org/ws/2005/05/identity/claims. There should be an AttributeValue sub-node and it should contain the account username (e.g., "Ismith") that was 2664

 used to authenticate at the identity provider (e.g., <saml:AttributeValue>lsmith</saml:AttributeValue>).

Expected Result: Verify that the name (and case) of the attribute (noted by the AttributeName) is identical to the name configured at the SharePoint using Powershell earlier in this section. Verify that the AttributeNamespace is identical to the IncomingClaimType option configured at the SharePoint using Powershell earlier in this section. If the name or namespace of the attribute being passed to SharePoint does not match with the SharePoint configuration, SharePoint will not allow access to the site, and direct your browser back to the SharePoint Sign On screen.

11. If you verified that the name and namespace of the expected attribute match with the SharePoint configuration and SharePoint does not direct your browser to the site home page, follow the instructions in the Troubleshooting SharePoint Federated Authentication Problems section to determine the cause of the problem.

<u>Expected Result</u>: Go back to the main browser window. The SharePoint server should present the site home page. You should see the account username of the user that authenticated in the upper right corner of the page.

5.6 Troubleshooting SharePoint Federated Authentication Problems

If you encounter a situation where SharePoint is not allowing a federated user access to the site, you may have a problem with the authentication configuration. A symptom that indicates you have an authentication configuration problem is when a user successfully signs on at the identity provider, then the user is redirected back to the SharePoint site, and instead of displaying the site home page, SharePoint presents the SharePoint Sign On screen again. This section describes how to determine the root cause of this type of authentication problem so that the problem can be resolved.

<u>Note</u>: A SharePoint access control problem is a distinctly separate issue from authentication. A symptom of an access control problem is when the user received a message that states "This site has not been shared with you" upon successful authentication. Access control problems can be resolved by setting up

2720

2721

SharePoint permissions on the People and Groups administration page, located in the Site Settings,
Users and Permissions group.

2694 Follow the instructions below to troubleshoot federated authentication problems at the SharePoint site.

Before you configure diagnostic logging for the SharePoint site to determine the root cause of the authentication problem, check the following items first:

- Verify that the relying party's PingFederate Server and the relying party's SharePoint Server synchronize their clocks from the same source. If both servers are on the same domain, they should be synchronized with the domain controller automatically. Logon to both servers and verify that the clocks display the same time.
- Verify that the expiration time of the security token generated by the PingFederate Server is more than 10 minutes. SharePoint calculates the time length of its session using the formula: SharePointSessionTime = SecurityTokenLifeTime LogonTokenCacheExpirationWindow. SecurityTokenLifeTime is the length of time the token is valid, and this time is generated by the PingFederate server when it issues the token. By default the SharePoint LogonTokenCacheExpirationWindow is set to 10 minutes, therefore the SecurityTokenLifeTime must be greater than 10 in order to generate a SharePointSessionTime greater than zero. In our build we set the SecurityTokenLifetime to 20 minutes in the PingFederate configuration.
 - The expiration time of the security token can be set in the configuration of the SP Connection on the relying party's PingFederate server. When you open the configuration for the SP Connection, click on the Assertion Lifetime link in the Browser SSO section. Enter a value for the Minutes After field that is greater than 10 (e.g., 20).

Cancel Next > Done Save

If you checked the items in the previous section and you are still encountering authentication problems, you will need to examine detailed authentication logs on the SharePoint server. Follow the instructions below to configure diagnostic logging on the SharePoint server and analyze the logs to determine the root of the authentication problem.

- 1. Perform the instructions at the link below to change the levels of ULS authentication logging on the SharePoint server. Make sure that you perform the instructions in the following two sections of the article:
 - "To configure SharePoint 2013 for the maximum amount of user authentication logging"

2748

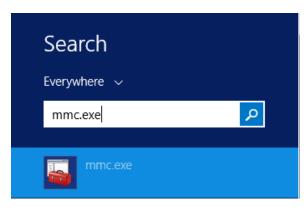

2722		"To find the failed authentication attempt manually"
2723		https://technet.microsoft.com/en-us/library/JJ906556.aspx
2724 2725		Once you configure the SharePoint diagnostic authentication logging, perform the sign on process to your SharePoint again to generate activity in the log.
2726 2727		Since the SharePoint ULS log file contains many entries, it can be helpful to copy the file to another computer and analyze it offline.
2728 2729		Open a copy of the log file and scroll to the bottom of the file. The bottom of the log contains the most recent activity.
2730 2731 2732	E	Starting at the bottom of the file, perform an upward search for the term "authentication". Examine the entries that are labeled either "Claims Authentication" or "Authentication Authorization".
2733 2734 2735	Look at the details for each of these two types of authentication entries to look for clues regarding what the source of the problem could be. You may have to look through several entries in the file to understand the sequence of events.	
2736 2737		this approach to troubleshoot an authentication problem in our lab. We found the following the log file, that seemed as though it could be the source of the problem:
2738 2739		security token '0e.t federated logon from identity provider lsmithcc221cd9-23d7-4302-b029-ee81784754d2_Internet' is found in the local cache, but it is expired. Returing Null.
2740	Two line	s further down in the file, we found the following entry as well:
2741 2742		token cache: Failed to find token for user 'Oe.t federated logon from identity provider Ismith' for cookie so signing out the user
2743 2744 2745 2746 2747	cache, be performi describe	the log file, we performed an Internet search for the term "security token is found in the local ut it is expired. Returing Null". By researching various Internet blogs and forums, and ing additional analysis of the log file, we found a blog article on the Pingldentity website that d why the lifetime of the security token generated by the PingFederate-RP must be greater than tes when issuing a token for SharePoint. Once we updated the associated configuration on the

PingFederate-RP, the authentication problem was resolved.

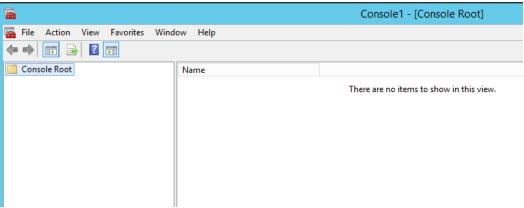

2749	6 Attribute Exchange between the Identity Provider and	
2750	Relying Party	
2751	6.1 Introduction	
2752 2753	In previous sections of this How-To Guide, we demonstrated foundational steps to building an ABAC solution:	
2754	 configuring federated authentication at the PingFederate-IdP 	
2755	 configuring the SAML exchange between the PingFederate-IdP and PingFederate-RP 	
2756	 configuring the Relying Party's SharePoint site 	
2757	 configuring the federated logon at the SharePoint site 	
2758	Building upon that foundation, this section describes how to:	
2759	 create custom attributes and set values for them in Microsoft AD 	
2760	 configure the PingFederate-IdP to pull user and environmental attributes during authenticatio 	n
2761 2762	 configure the PingFederate-RP to pass the user and environmental attributes to the RP's SharePoint 	
2763 2764	 configure SharePoint to load the user and environmental attributes passed from the PingFederate-RP into the web session 	
2765 2766 2767	If you follow the instructions in this How-To Guide section, you will be able to perform a Functional Test to verify the successful completion of the steps for installing, configuring, and integrating the components.	
2768	6.2 Create Custom User Attributes in Microsoft AD	
2769 2770 2771	Follow the instructions in this section to create custom user attributes in the Microsoft AD schema. You will add a new attribute and add it to the "user" class. Microsoft AD user accounts inherit from the "user" class; therefore, the new attribute will be available to all of the users in the domain.	
2772	6.2.1 Preparing the AD Schema for Creating New Custom Attributes	
2773	6.2.1.1 Backing Up Your Directory before Making Schema Changes	
2774 2775 2776	Microsoft recommends that you back up your directory before making schema changes. Choose the names of your new custom attributes carefully, because the creation of a new attribute is a permanent operation.	
2777 2778	 Log on to the server that contains the Microsoft AD schema (typically the schema is on the domain controller). 	
2779	2. Launch a Command Prompt, using the Run as Administrator option.	
2780 2781	Execute the following command: regsvr32 schmmgmt.dll	

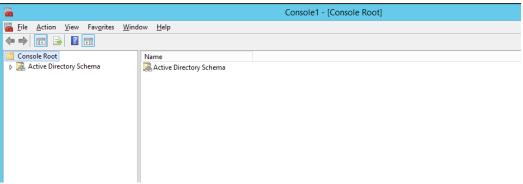

- 4. Click the **Start** button and enter **mmc.exe** in the search field.
- 5. Launch the mmc.exe program.

2785

- 2787 6. Click on the **File** menu. Then, click **Add / Remove Snap-in**.
- Click on Active Directory Schema in the list of Available snap-ins on the left; then, click Add to
 add it to the Selected snap-ins on the right.
- 2790 8. Click **OK**.

2792

2793

9. Expand the Active Directory Schema on the left.

6.2.1.2 Reviewing Existing Attributes to Avoid Redundancies when Creating New Attributes

Before you create a new attribute, it is important to review existing user attributes in your Active Directory Schema. Under Active Directory Schema on the left, expand the Classes folder and scroll down to click on the **user** class. Examine the existing set of **user** class attributes listed on the right. These attributes are native to Active Directory, and can be assigned to users as subject attributes. These attributes may meet existing requirements for implementing subject attribute, alleviating the need to add custom attributes to the schema. You can list the attributes in alphabetical order by clicking on the **Name** column.

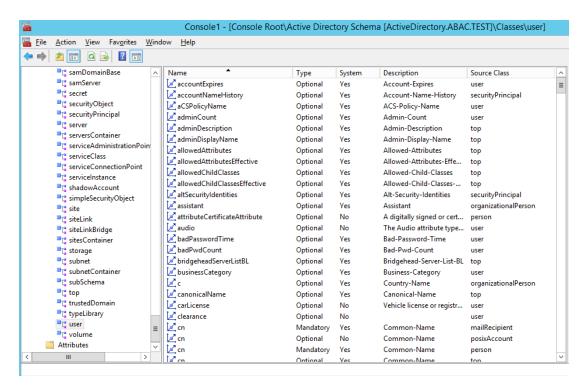

2796

2797

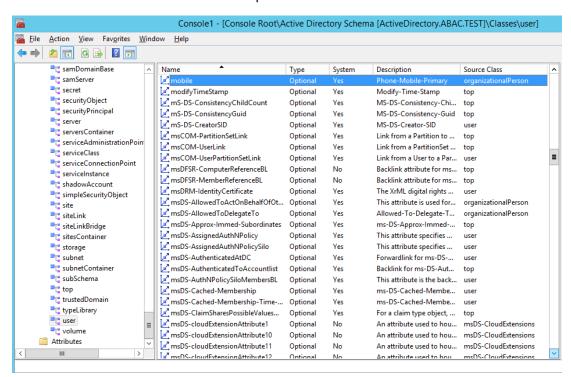

2798

2799

2800 2801

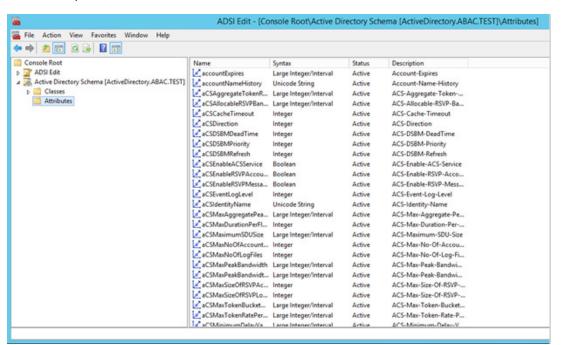

If you wanted to create an attribute to store the user's cell phone number, you would look through the attributes and notice that the attribute **cellphone** does not exist. However, there is an attribute named **mobile** that could be used to store a cell phone number.

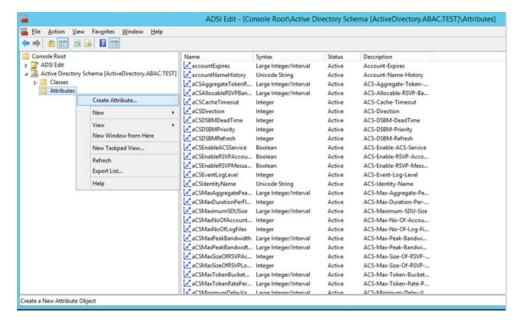

Once you have identified that the creation of a new attribute is warranted, proceed with the following instructions.

2810 6.2.1.3 Creating New Custom Attributes

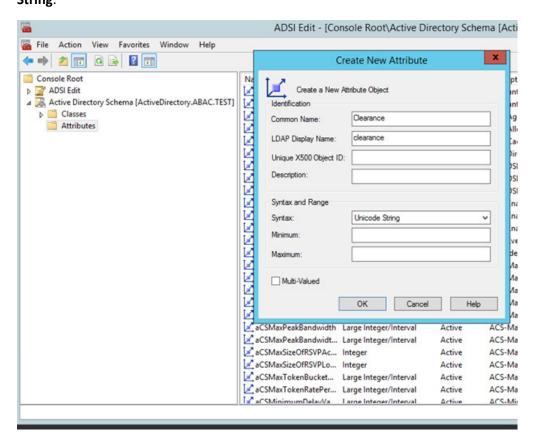

- Launch a browser window and go the Microsoft site:
 https://gallery.technet.microsoft.com/scriptcenter/56b78004-40d0-41cf-b95e-6e795b2e8a06
- 28. Copy the **oidgen.vbs script** code that is shown on the page to the clipboard.
- 3. Open **Notepad** and paste the script into the editor.
- 2815 4. Save the script to a file on the desktop named **oidgen.vbs**.
- 2816 5. Go back to the Active Directory schema window.
- 2817 6. On the left pane, click on the **Attributes** folder.

- 2818
- 7. Right-click on the **Attributes** folder and select Create Attribute.
- 2820 8. Click **Continue** on the warning window.

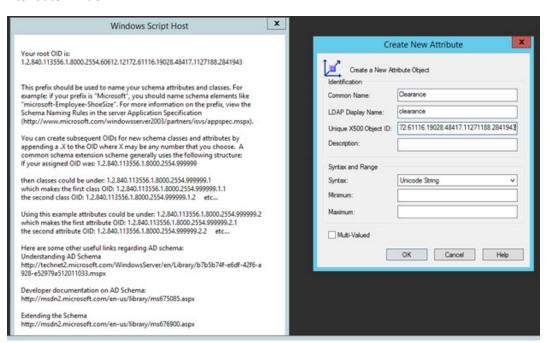

9. Enter the name of your new attribute and select the type of attribute in the Syntax field. In the example below, the name of the new attribute is **clearance** and the type of attribute is **Unicode String**.

2826 6.2.1.4 Generating an ID to Enter into the Unique X500 Object ID Field

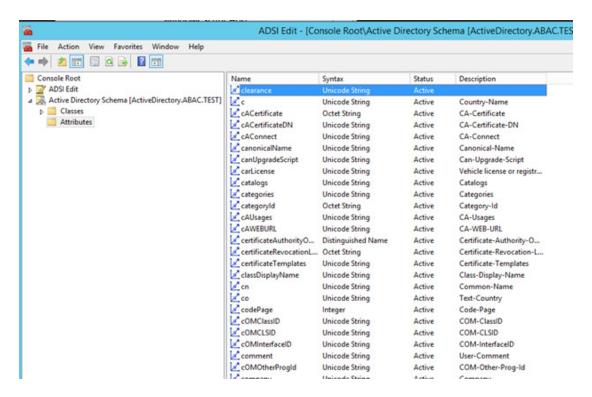

- Next, you need to generate an ID to enter into the Unique X500 Object ID field.
- 1. Go to the desktop and double-click on the **oidgen.vbs script** that was saved earlier. This should execute the script to generate a unique Object ID.
 - Enter this long Object ID into the Unique X500 Object ID field in the Active Directory Create New Attribute window.

2832

2830

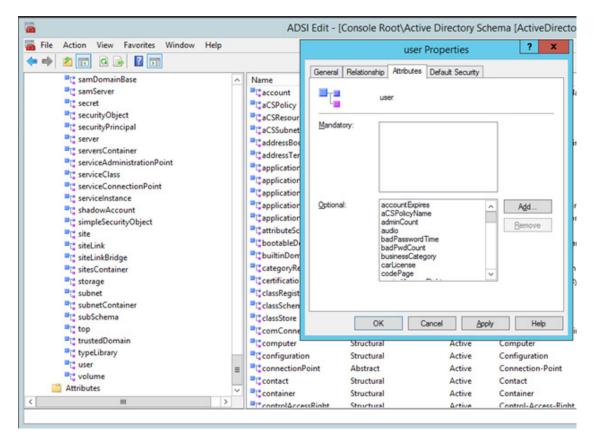

- 2833 3. Click **OK** to create the new attribute.
- 4. Scroll down the list of attributes and make sure your newly added attribute is listed there.

2836

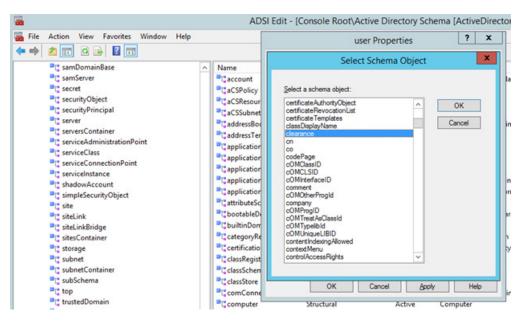

6.2.1.5 Adding the New Attribute to the User Class

- Next, you need to add the new attribute to the user class.
- 1. In the left pane, expand the Classes folder. Scroll down the list of classes, right-click on the **user** class, and select **Properties**.
- 2840 2. Click on the **Attributes** tab.

2842

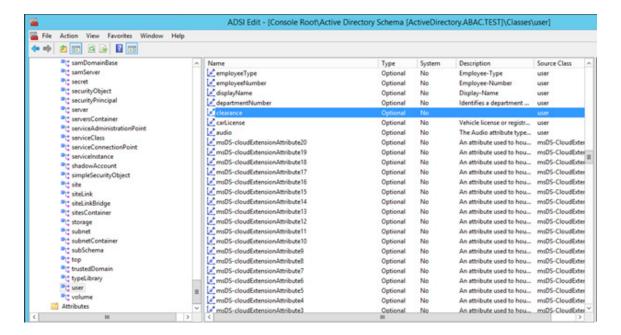

3. Click Add. Scroll down and click on the new attribute.

2843

2844

- 4. Click **OK** on the Select Schema Object window, and then click OK one more time on the user properties window. At this point, you have added the new attribute to the **user** class.
- When you examine the list of attributes for the **user** class, you should be able to see the new attribute.

2849 2850

2851

2852

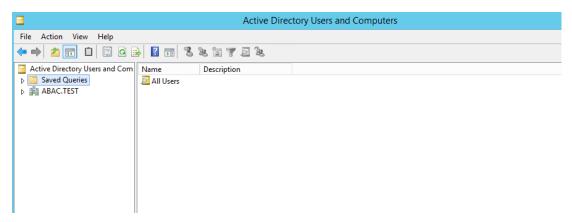

2853

2854

6.2.2 Set Values for Custom User Attributes in Microsoft AD

Once you have created a new custom attribute in the Active Directory **user** class, that new attribute will be available for all users in the domain. You will be able to set specific values for the new attribute for each distinct user. Follow the instructions in this section to set a user-specific value for a new attribute in Active Directory.

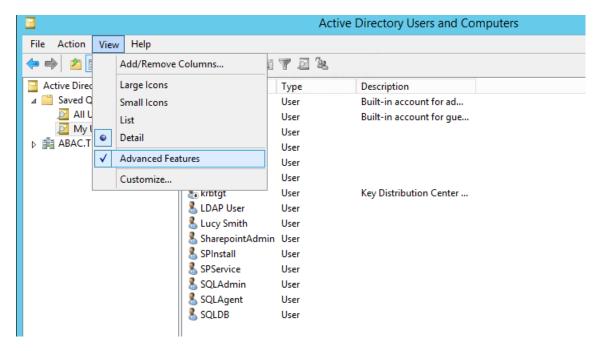

- 1. Log on to the Microsoft AD server.
- 2855 2. Open the Active Directory Users and Computers program.

2856

2857

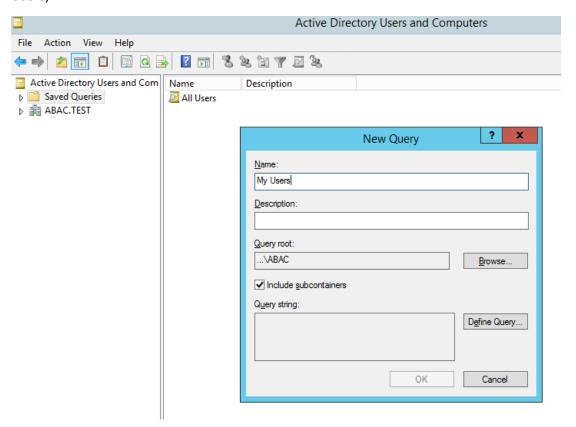

3. Click on the **View** menu and select **Advanced Features**.

2859

2860

 Right-click on Saved Queries and select New > Query. Enter a name for your query (e.g., My Users).

2861

2862

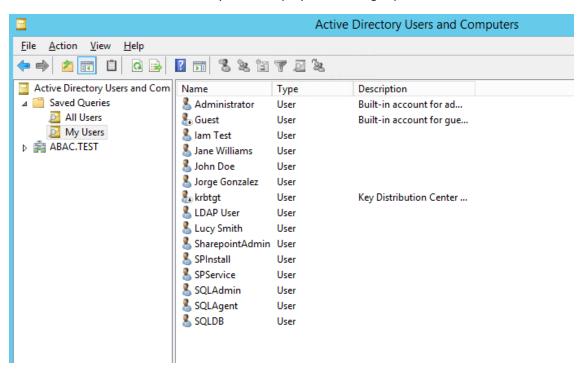

5. Click on **Define Query**. From the **Name** list, select **Has a value**.

2865

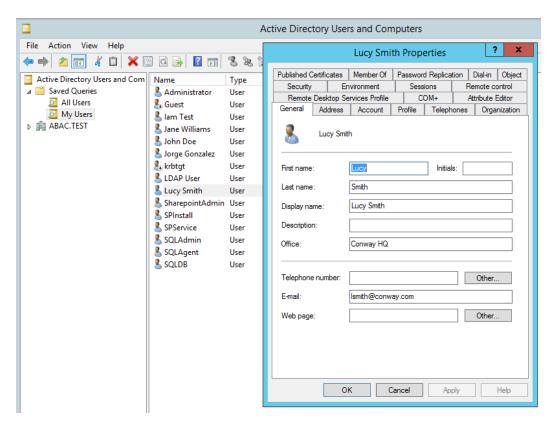

6. Click **OK**. Then, click **OK** again to create your new query.

You will see a list of Active Directory Users displayed in the right pane.

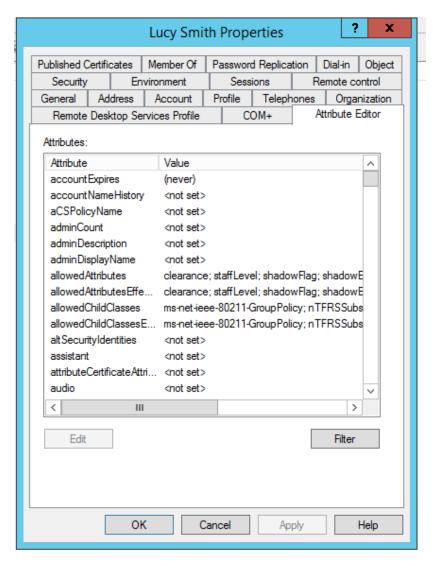

2866

7. Double-click on the specific user (e.g., **Lucy Smith**) that you want to modify to bring up the properties window.

2869 2870

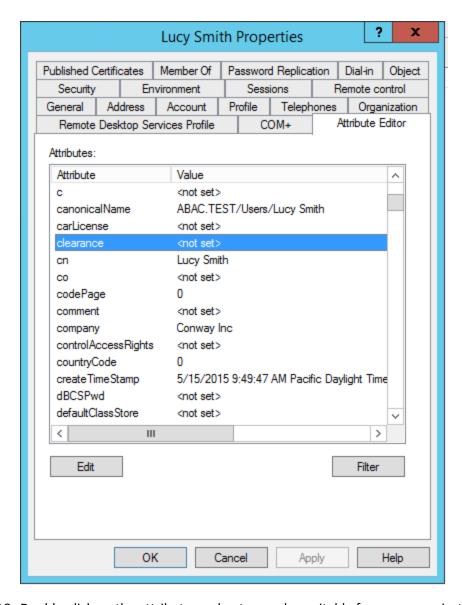

Click on the Attribute Editor tab.

2872

2873

9. Scroll down and locate the new custom attribute for which you want to set a value (e.g., clearance).

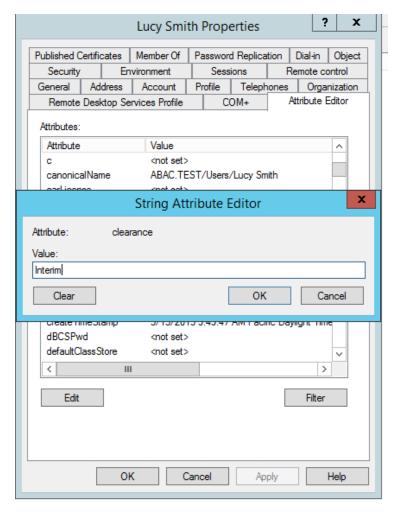

2875 2876

2877

2878

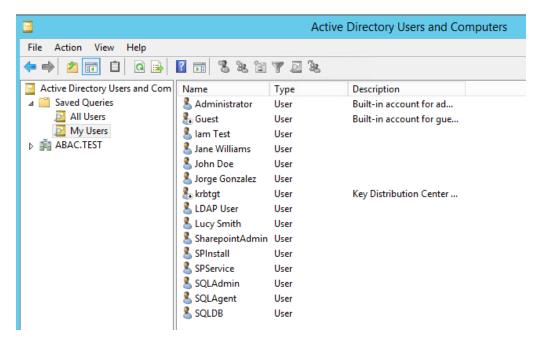

- 10. Double-click on the attribute, and enter a value suitable for your organization. In this example, the clearance attribute will be set to a value of Interim for the user Lucy Smith in subsequent
- 11. Click **OK** and then click **OK** again. The information is saved and the User Properties window closes.

Note: When you set an attribute value in the attribute editor and then go back to the Users query view, you have to press F5 or click the **Action menu > Refresh** to see the new value.

6.2.2.1 Adding New Columns to the Users Query View

Next you will add new columns to the Users query view to help monitor the custom attribute values for each user in the directory. By default, the Users view only shows the attribute values for **Name**, **Type**, and **Description**.

2890

2891

2893

2894

2895

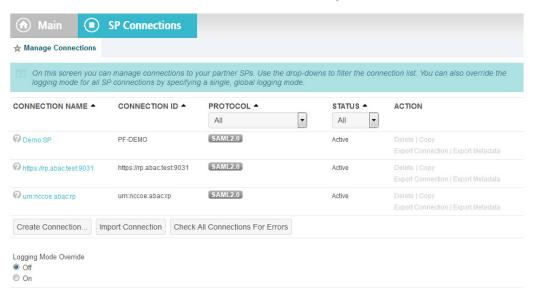

- 1. In the Saved Queries folder, click on the name of the query to be modified (e.g., **My Users**).
- 2889 2. Click on the View menu and select Add/Remove Columns...
 - 3. From the list of Available columns, scroll up or down to find desired columns.
 - 4. Click on column name and click on the **Add** button.
- 5. When all desired columns have been chosen, click **OK**.

The following screenshot shows a query view after adding custom attribute columns. The example contains new columns for the attributes **User Logon Name**, **Company**, **Department**, **Title**, **Staff Level**, and **Clearance**.

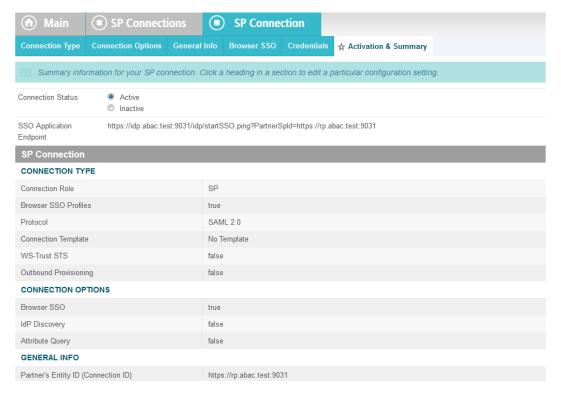

2897 6.3 Configure PingFederate Servers to Pull User Attributes

- 2898 6.3.1 Configure PingFederate-IdP to Pull User Attributes During Authentication
- Follow the instructions in this section to configure the PingFederate-IdP to pull user attribute values from Microsoft AD and Cisco ISE during the authentication process. In the following example, the value for the user attribute **company** is extracted from Microsoft AD.
- 2902 1. Launch your browser and go to https://<DNS NAME>:9999/pingfederate/app.
- 2. Replace **DNS_NAME** with the fully qualified name of the IdP's PingFederate server (e.g., https://idp.abac.test:9999/pingfederate/app).
- 2905 3. Log on to the PingFederate application using the credentials you configured during installation.
- 2906 4. On the Main Menu under SP CONNECTION, click Manage All SP.

29072908

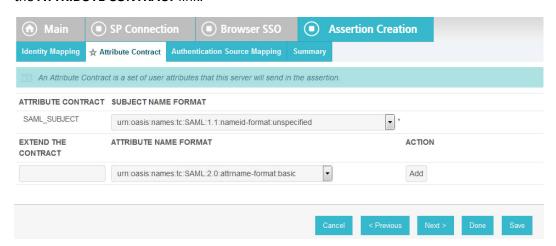

5. Click on the link for the connection created in Section 3 (e.g., https://rp.abac.test:9031).

2910

2911

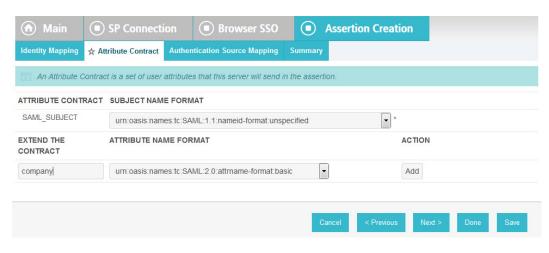

6. On the Activation & Summary screen, scroll down to the **Assertion Creation** group and click on the **ATTRIBUTE CONTRACT** link.

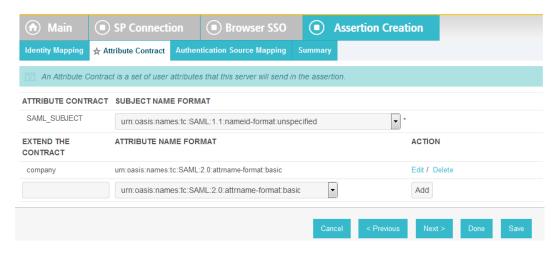

29122913

29142915

7. On the **Attribute Contract** screen, under the **EXTEND THE CONTRACT** column, enter the name of the attributes to be extracted from Microsoft AD, Cisco ISE, and RSA AA (e.g., **company**) in the empty text field.

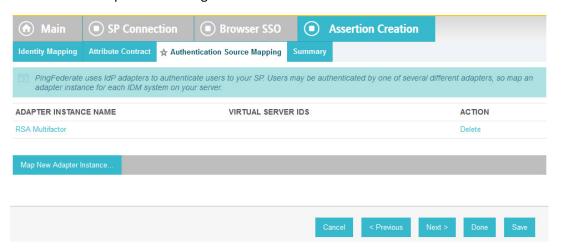

2917 8. Click Add.

29182919

9. Click **Save** to complete the configuration.

2921 6.3.1.1 Functional Test of Pulling User Attributes During Authentication

- 2922 The instructions in this section will help you perform a test to ensure that the Identity Provider is getting
- the configured attributes (e.g., company) from Active Directory and passing them in a SAML message to
- the RP. The Firefox SAML tracer add-on is used to examine the SAML message.
- 2925 Follow the instructions in the section Temporarily Disable SAML Encryption for Testing and
- 2926 Troubleshooting Message Exchanges at the end of this section to disable SAML encryption. Once SAML
- 2927 encryption has been disabled, you can proceed with the following functional test instructions.
- 2928 1. Launch your Firebox browser and select **SAML tracer** from the **Tools** menu.
- 2929 This launches an empty SAML tracer window.
- 2930 2. Minimize the SAML tracer window.
- 2931 The SAML tracer automatically records the details of the HTTPS messages in the background.
 - 3. Go back to the main browser window and go to the RP's SharePoint site (e.g., https://SharePoint.abac.test).

Sign In

Select the credentials you want to use to logon to this SharePoint site:

2934

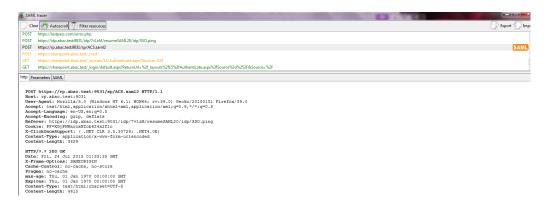

2938

2939

2940

2932

- 2935 4. Select **Federated Logon from Identity Provider**.
- 5. In the Identity Provider's PingFederate Sign On screen, enter the credentials for the account you are testing with (e.g., **Ismith**) and click **Sign On**.
 - 6. On the RSA two-factor authentication screen, enter the validation code and proceed. The browser redirects you to the PingFederate-RP and then to the RP's SharePoint site. You may not notice the redirection to the PingFederate-RP if it happens quickly.
- 7. Go back to the SAML tracer window. Scroll down and click on the last **POST** message that contains a SAML icon.

2945

8. Click on the **SAML** tab. Scroll down the SAML message and locate the AttributeStatement node and sub nodes.

29462947

2948

2949

2950

2951

29522953

2954

<u>Expected Result:</u> Ensure that the attribute you configured from Microsoft AD contains a node. In the example screenshot above, you can see that there is an Attribute node for the **company** attribute because of the line **<saml:Attribute Name="company"**.

<u>Expected Result:</u> Ensure that the AttributeValue node contains the expected value for the attribute from ActiveDirectory. In the example screenshot above, you can see there is an AttributeValue node for the **company** attribute and the value is **Conway Inc**. This is correct, because in our Microsoft AD environment, the user account we tested with is **Ismith** (Lucy Smith), and Lucy's **company** attribute in Microsoft AD is set to a value of **Conway Inc**.

When you complete this functional test, you must enable SAML encryption between the IdP and RP again. Follow the instructions in the section Temporarily Disable SAML Encryption for Testing and Troubleshooting Message Exchan*ges*, subsection Enable SAML Encryption at the end of this section

again to enable SAML encryption.

2960

2961

2962

29632964

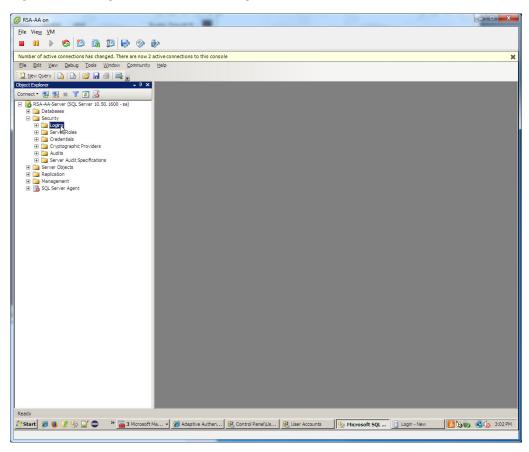

2965

2974

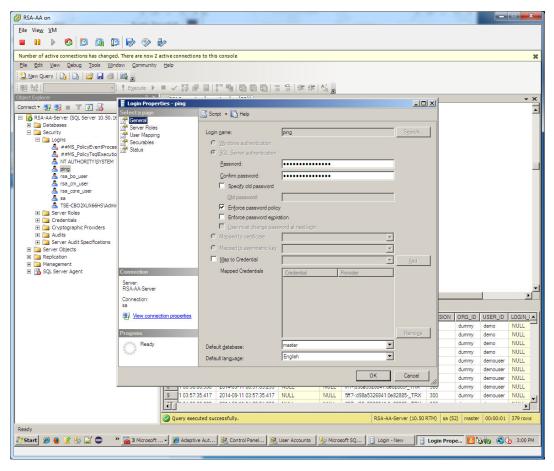

6.3.2 Configure PingFederate-IdP to Pull Environmental Attributes During Authentication

Follow the instructions in this section to configure the PingFederate-IdP to get environmental attribute values from the RSA Adaptive Authentication system during the authentication process. The environmental attributes are passed along with the user attributes in the SAML messages that is sent to the RP. In the example below, the environmental attribute **ip_address** will be pulled from RSA Adaptive Authentication.

- 2966 RSA Adaptive Authentication stores environmental attributes about the user's web transactions in a SQL Server database named RSA_CORE_AA. The PingFederate-IdP will be configured to query to the
- 2968 **RSA_CORE_AA** database and get the value of **ip_address** from the **EVENT_LOG** table.
- 2969 Before you can configure the query for **ip_address**, you must first create an account for the
 2970 PingFederate application in the **RSA_CORE_AA** database. Follow the instructions below to create the
 2971 account in the SQL Server database.
- 2972 Log on to the server that hosts the RSA Adaptive Authentication SQL Server database engine.
- 2973 1. Open SQL Server Management Studio.
 - 2. Expand the **RSA-AA-Server** folder, then the **Security** folder.
- 2975 3. Right-click on **Logins** and select **New Login**.

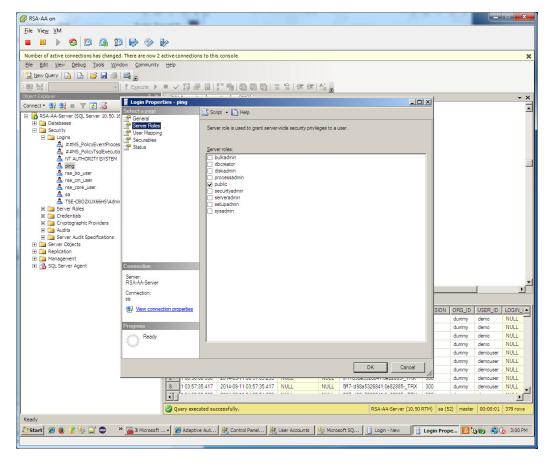

4. Set the **Login name** (e.g., **ping**), under **SQL Server authentication** and choose a password that meets the Windows password policy.

2979

2980

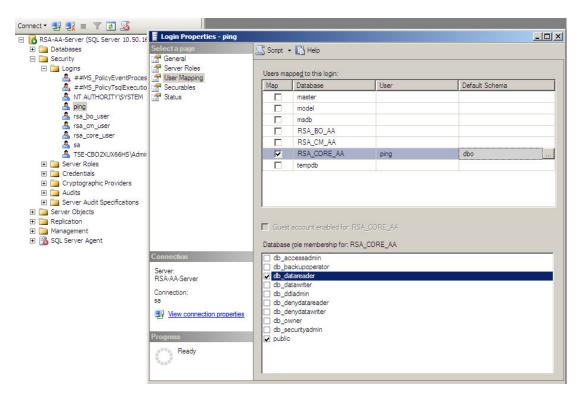

5. Under Server Roles, select public.

Under User Mapping, check the Map box next to **RSA_CORE_AA**. In the bottom pane, under **Database role membership**, check the box next to **db_datareader**.

2982

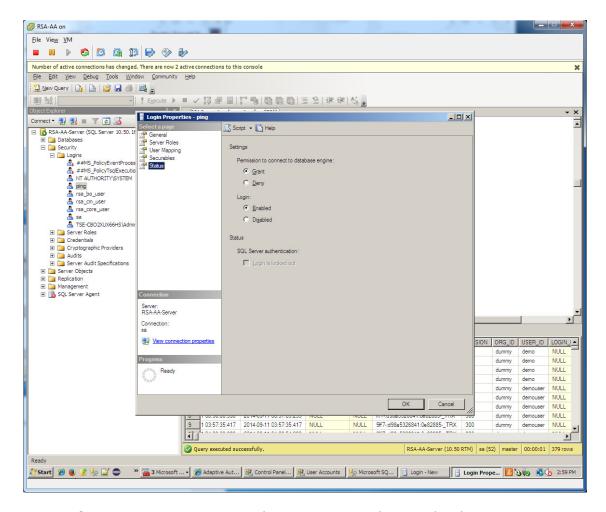

SECOND DRAFT

29842985

2986

6. Under **Status**, set permission to connect to database engine to **Grant** and **Login** to **Enabled**. Click **OK**.

2988

2989

2991

2992

2993

2994

2995

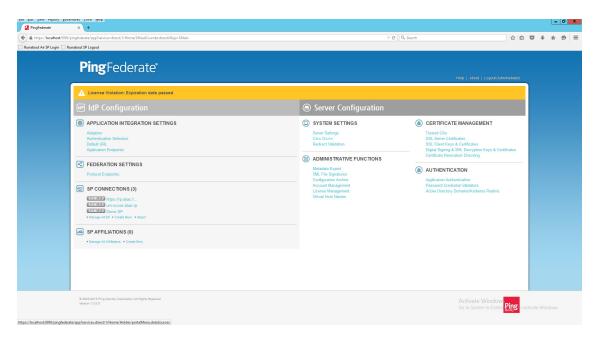

2996

6.3.2.1 Configuring a New Data Store that Connects to the RSA database

Next, you will configure a new Data Store that connects to the **RSA_CORE_AA** database on the Identity Provider's PingFederate server. This new data store will be used in the RP Connection to query the EVENT_LOG table during the authentication process.

Follow the instructions below to create a new Data Store for the RSA_CORE_AA database.

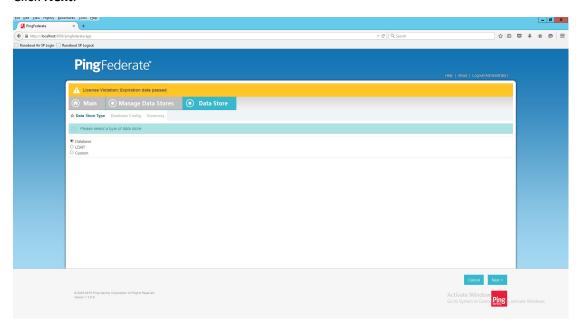

- Launch your browser and go to https://<DNS_NAME>:9999/pingfederate/app. Replace <DNS_NAME> with the fully qualified name of the IdP's PingFederate server (e.g., https://idp.abac.test:9999/pingfederate/app).
- 2. Log on to the PingFederate application using the credentials you configured during installation.
- 2997 3. Under **Server configuration**, select **Data Stores**.

2999

3000

4. Under Manage data stores, select Add new data store. Select Database as type of data store. Click Next.

3001 3002

3003

 On the database config page, set the JDBC URL to: jdbc:sqlserver://<RSA_SERVER_IP_ADDRESS>:1433;databaseName=RSA_CORE_AA

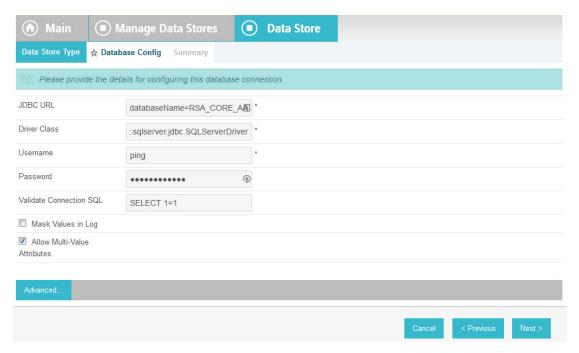

3004 3005 Replace <RSA_SERVER_IP_ADDRESS > with the IP address of the server that hosts the RSA_CORE_AA database.

3006

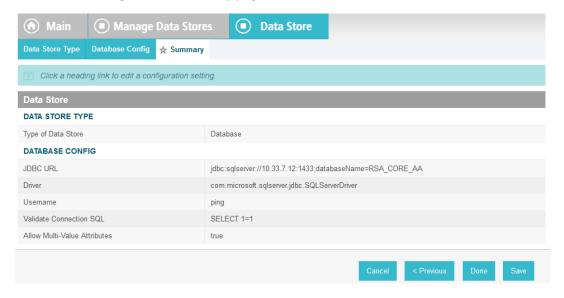

6. Set the driver class to **com.microsoft.sqlserver.jdbc.SQLServerDriver**

3007 3008 7. In the **Username** and **Password** fields, enter the credentials for the Ping user created in the SQL server RSA Database.

- 3009 8. Under Validate Connection SQL, type SELECT 1=1.
- 9. Check the box to allow multi-value attributes. Click **Next**.

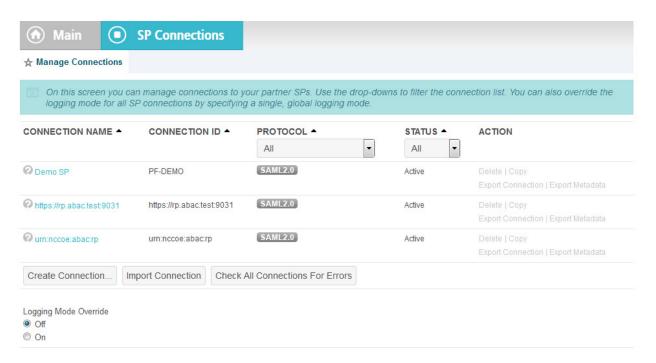

3012 10. Review the settings on the summary page. Then, click **Save**.

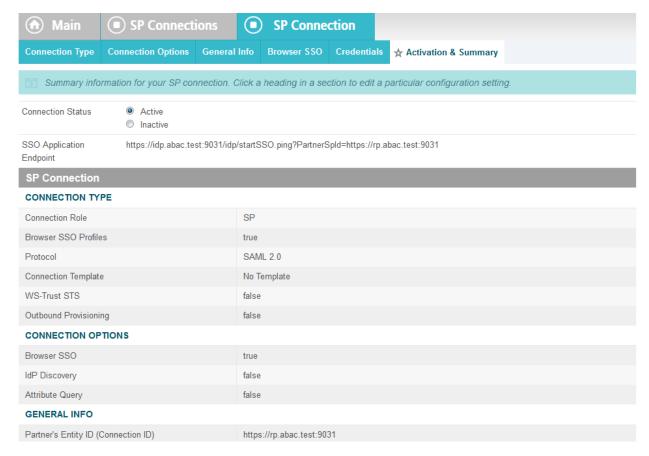

3013

- 6.3.2.2 Modifying the SP Connection to the RP to Add New Environmental Attribute
- Next, you will modify the SP Connection to the RP and add a new environmental attribute, **ip_address**, from the RSA_CORE_AA database.
- 1. Go to the PingFederate main menu. On the **Main** menu under **SP CONNECTION**, click **Manage**3018 **All SP**.

2. Click on the link for the SP connection created in <u>Section 2</u> (e.g., https://rp.abac.test:9031).

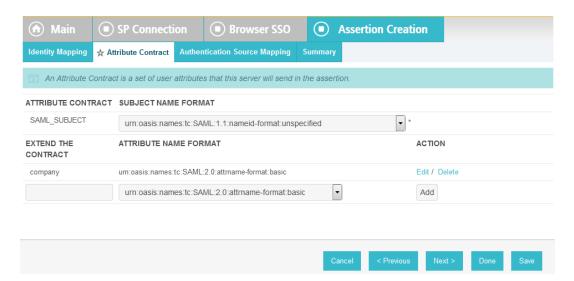

3021 3022

3023

3. On the **Activation & Summary** screen, scroll down to the **Assertion Creation** group and click on the **ATTRIBUTE CONTRACT** link.

SECOND DRAFT

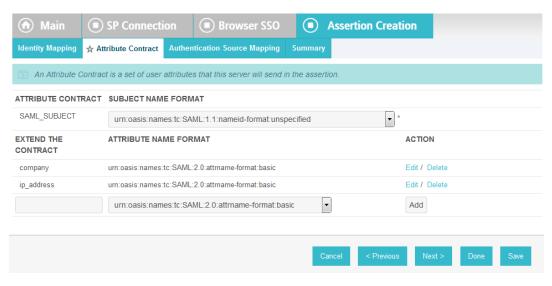

3024 3025

3026

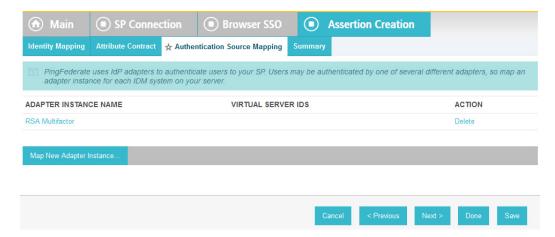

3027

- 4. On the **Attribute Contract** screen, under the **EXTEND THE CONTRACT** column, enter the name of the environmental attribute to be pulled from the RSA_CORE_AA database (e.g., **ip_address**) in the empty text field.
- 3028 5. Click **Add**.

3029

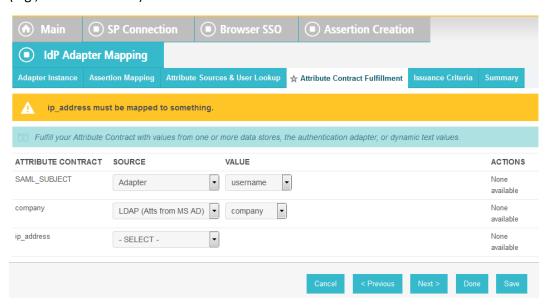

3030 6. Click **Next**.

3032

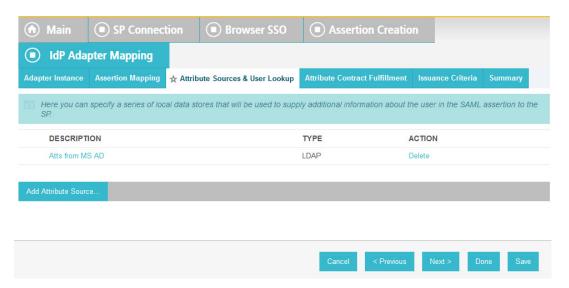

3033

7. On the **Authentication Source Mapping** screen, click on the name of the **ADAPTER INSTANCE** (e.g., **RSA Multifactor**).

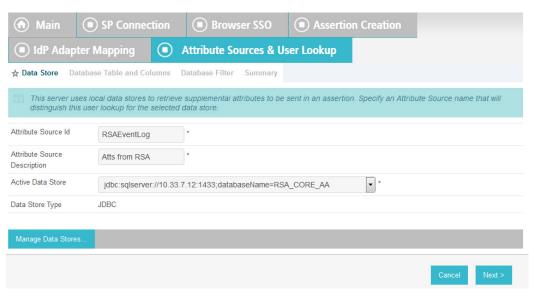

3034 3035

8. Click on the **Attribute Sources & User Lookup** tab.

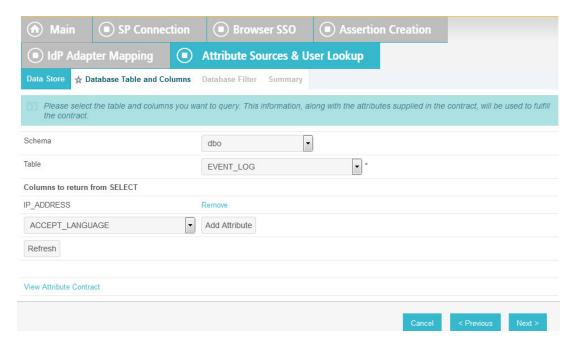

3037

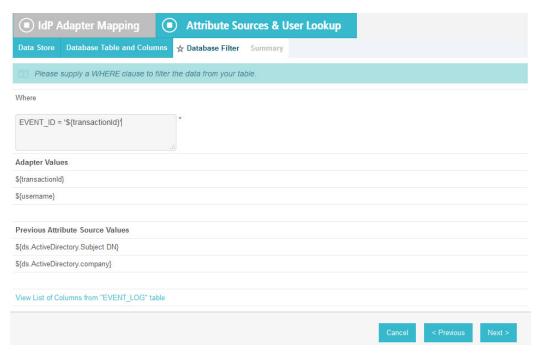

- 9. Click Add Attribute Source.
- 3038 10. On the **Attribute Sources & User Lookup** screen, enter a unique name in the **Attribute Source Id** field (e.g., **RSAEventLog**).
- 3040 11. Enter a description (e.g., Atts from RSA).
- 3041 12. For the **Active Data Store** field, select the existing Data Store that connects to the RSA_CORE_AA database.

- 3044 13. Click **Next**.
- 3045 14. On the **Database Table and Columns** screen, select the **dbo** Schema.
- 3046 15. Select the **EVENT_LOG** table.
- 3047 16. Under the Columns to return from SELECT, select the IP_ADDRESS column and click Add3048 Attribute.

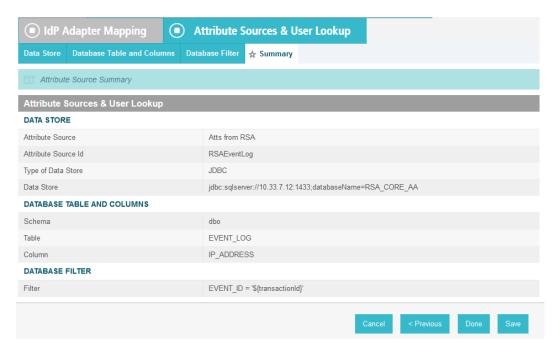

- 3050 17. Click **Next**.
- 3051 18. On the **Database Filter** screen, enter the text on the following line into the text field for the 3052 **Where**. Make sure to include the quotes.
- 3053 **EVENT_ID = '\${transactionid}'**

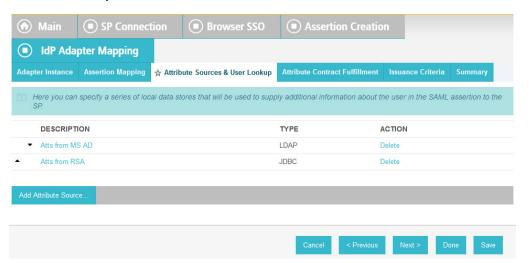

3054

3055 19. Click **Next**.

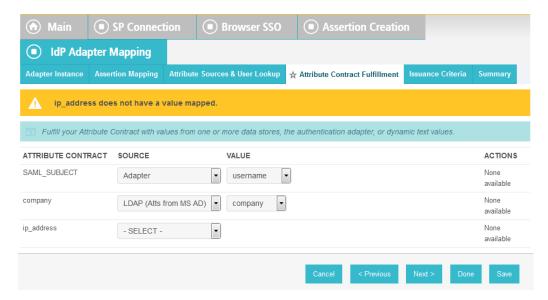

3057 20. On the **Summary** screen, click **Done**.

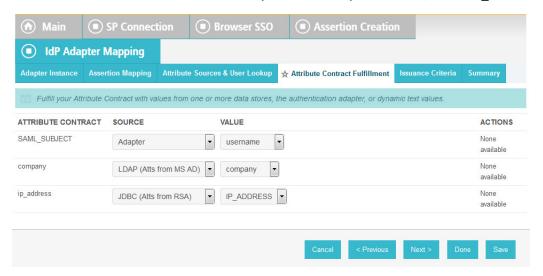

3058

3059

21. On the Attribute Sources & User Lookup screen, click Done.

 22. On the **Attribute Contract Fulfillment** screen, for the **ip_address** attribute, select the **SOURCE** and **VALUE**. For the **SOURCE**, select **JDBC** (Atts from RSA). For **VALUE**, select **IP_ADDRESS**.

 23. Click **Save** to complete the configuration.

6.3.2.3 Functional Test of Pulling Environmental Attributes during Authentication

To test that the Identity Provider's PingFederate server is successfully getting the environmental attributes during the authentication process, follow the instructions in the section Functional Test of Pulling User Attributes during Authentication. The only exception to those instructions is that when you examine the SAML message, you need to look for the environmental attribute that is being pulled from the RSA CORE AA database. See below for an example.

1. Once you have the message open in the SAML tracer window, scroll down the message and locate the **AttributeStatement** node and sub-nodes.

```
http Parameters SAML
                                   <saml:Conditions NotBefore="2015-07-30T20:09:53.495Z"</p>
                                                                                           NotOnOrAfter="2015-07-30T20:19:53.495Z"
                                                <saml:AudienceRestriction>
                                                            <saml:Audience>https://rp.abac.test:9031</saml:Audience>
                                                </saml:AudienceRestriction>
                                  </saml:Conditions>
                                  <saml:AuthnContext>
                                                            < saml: AuthnContextClassRef> urn: oasis: names: tc: SAML: 2.0: ac: classes: unspecified </ saml: AuthnContextClassRef> urn: oasis: names: tc: SAML: 2.0: ac: classes: unspecified </ saml: AuthnContextClassRef> urn: oasis: names: tc: SAML: 2.0: ac: classes: unspecified </ saml: AuthnContextClassRef> urn: oasis: names: tc: SAML: 2.0: ac: classes: unspecified </ saml: AuthnContextClassRef> urn: oasis: names: tc: SAML: 2.0: ac: classes: unspecified </ saml: AuthnContextClassRef> urn: oasis: names: tc: SAML: 2.0: ac: classes: unspecified </ saml: AuthnContextClassRef> urn: oasis: names: tc: SAML: 2.0: ac: classes: unspecified </ saml: AuthnContextClassRef> urn: oasis: names: tc: SAML: 2.0: ac: classes: unspecified </ saml: AuthnContextClassRef> urn: oasis: names: tc: SAML: 2.0: ac: classes: unspecified </ saml: AuthnContextClassRef> urn: oasis: names: tc: SAML: 2.0: ac: classes: unspecified </ saml: AuthnContextClassRef> urn: oasis: names: tc: SAML: 2.0: ac: classes: unspecified </ saml: ac: classes: unspecified <
                                                </saml:AuthnContext>
                                   </saml:AuthnStatement>
                                  <saml:AttributeStatement>
                                               <saml:AttributeValue xsi:type="xs:string"</pre>
                                                                                                                                    xmlns:xs="http://www.w3.org/2001/XMLSchema"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
                                                                                                                                    >Conway Inc</saml:AttributeValue>
                                                 </saml:Attribute>
                                                </saml:Attribute>
                                  </saml:AttributeStatement>
                      </saml:Assertion>
       </samlp:Response>

3090

3091

3092

3093

3074 Expected Result: Ensure that the attribute you configured to be pulled from the RSA_CORE_AA
3075 database contains a node. In the example screenshot above, you can see that there is an
3076 Attribute node for the **ip address** attribute because of the line **<saml:Attribute**

Name="ip_address".

Expected Result: Ensure that the AttributeValue node contains the expected value for the attribute from the RSA CORE AA database. In the example screenshot above, you can see that

there is an Attribute Value node for the ip address attribute, and the value is 10.255.207.19.

6.3.3 Configure PingFederate-RP to Pull Attributes from the Identity Provider's SAML Exchange

Once the PingFederate-IdP completes the authentication for a user, the IdP will send a SAML message to the PingFederate-RP. That SAML message will contain attributes.

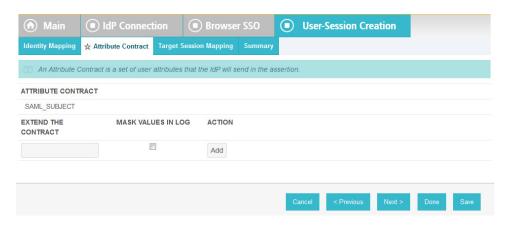

Follow the instructions below to configure the PingFederate-RP to get attributes and their associated values from the SAML message exchange with the IdP. In the example below, the attribute being configured at the RP is the **company** attribute.

- 1. Launch your browser and go to https://cDNS_NAME PingFederate/app. Replace DNS_NAME with the fully qualified name of the Relying Party's PingFederate server (e.g., https://rp.abac.test:9999/pingfederate/app). Log on to the PingFederate application using the credentials you configured during installation.
- 2. On the main menu, under **IDP CONNECTIONS**, click on the connection that was configured to the IdP in <u>Section 3</u> (e.g., https://idp.abac.test:9031).

3095

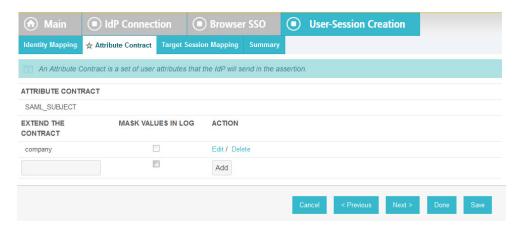

3096

3. On the **Activation & Summary** screen, scroll down to the **User-Session Creation** group and click on the **ATTRIBUTE CONTRACT** link.

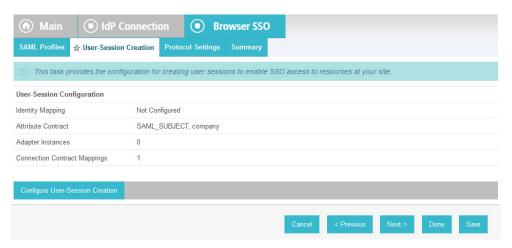

3097

3098 3099 3100 On the Attribute Contract screen, under the EXTEND THE CONTRACT column, enter the name of the attribute to be pulled from the IdP's message (e.g., company) in the empty text field. In the ACTION column, click Add.

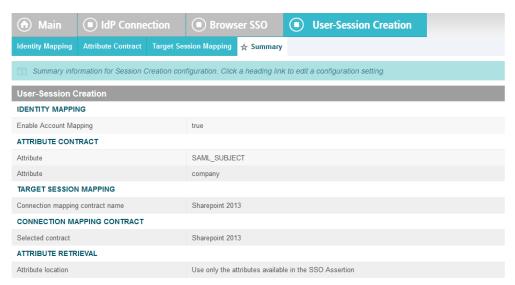

Click Done.

3103 3104

6. On the User-Session Creation screen, click Configure User-Session Creation.

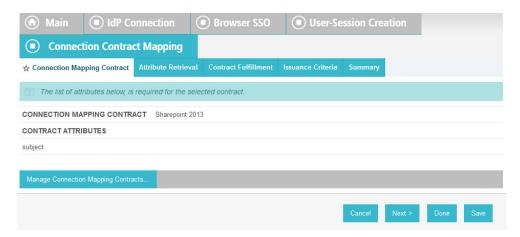

3105 3106

3107

7. On the **Summary** page, under **User-Session Creation**, click on the **CONNECTION MAPPING CONTRACT** link.

SECOND DRAFT

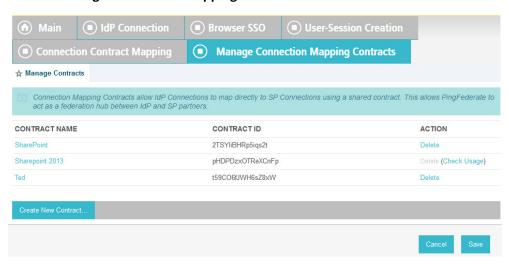

3108 3109

3110

3111

- 8. On the **Connection Mapping Contract** screen, make note of the **CONNECTION MAPPING CONTRACT** being used, because you will need to modify it by adding new attributes. In the example screenshots, the contract name is **SharePoint 2013**.
- 9. Click on Manage Connection Mapping Contracts.

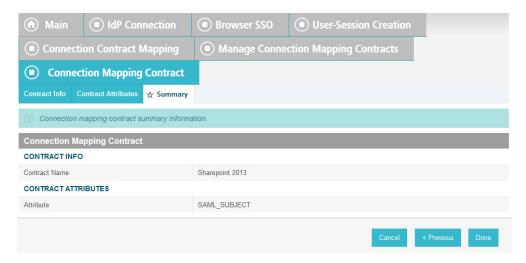

31133114

3115

10. On the **Manage Contracts** screen, click on the name of the contract that is being used for the current configuration (e.g., **SharePoint 2013**).

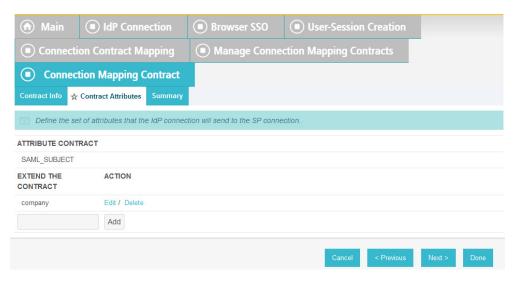

SECOND DRAFT

3116

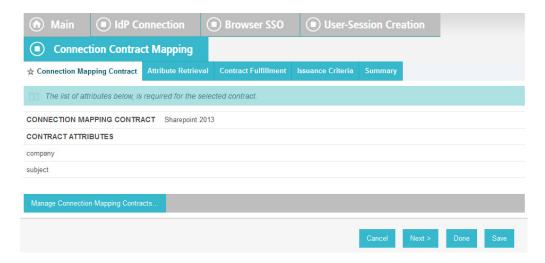

3117

- 11. On the **Summary** screen, click on the **Contract Attributes** link.
- 3118 12. On the **Contract attributes** screen, under the **EXTEND THE CONTRACT** column, enter the name of the attribute to be shared with the PingFederate service provider connection (e.g., **company**).
- 3120 13. In the **ACTION** column, click **Add**.

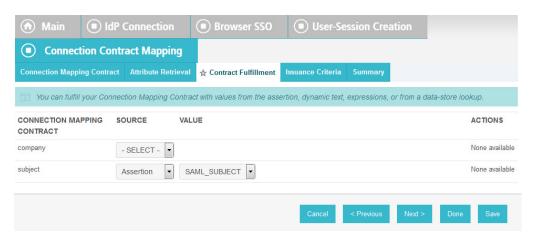

3121

- 14. Click Done.
- 3123 15. On the **Manage Contracts** screen, click **Save**.
- On the **Connection Mapping Contract** screen, you should see the new attribute (e.g., **company**) listed on the page.

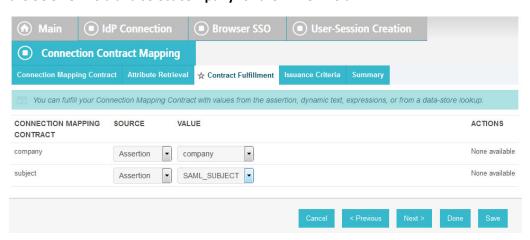

16. Click on the **Contract Fulfillment** tab.

31283129

3130

17. On the **Contract Fulfillment** screen, for the new attribute (e.g., **company**), select **Assertion** for the **SOURCE** field and select **company** for the **VALUE** field.

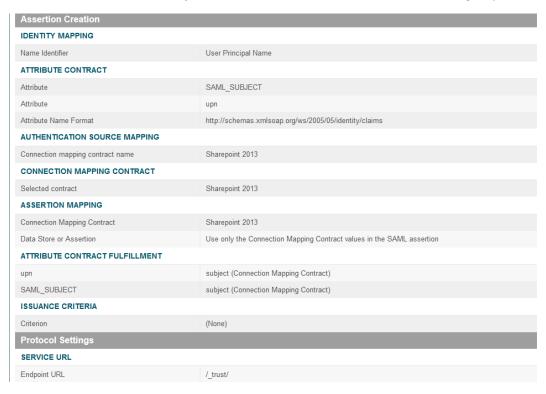

31313132

18. Click **Save** to complete the configuration.

3133 6.4 Configure PingFederate-RP and SharePoint to Pass and Read 3134 Attributes

- 3135 6.4.1 Configure PingFederate-RP to Pass Attributes to SharePoint
- Once the PingFederate-IdP completes the authentication for a user, the IdP will send a SAML message to
- 3137 the PingFederate-RP. That SAML message will contain attributes. The PingFederate-RP will then take the
- 3138 attributes and send them to SharePoint via WS-Federation.
- 3139 Follow the instructions below to configure the PingFederate-RP to pass attributes and their associated
- values from the IdP to SharePoint. In the example below, the attribute being configured to be passed to
- 3141 SharePoint is the **company** attribute.
- 1. Launch your browser and go to https://<DNS_NAME>:9999/pingfederate/app. Replace
 DNS_NAME with the fully qualified name of the RP's PingFederate server (e.g.,
- 3144 https://rp.abac.test:9999/pingfederate/app).
- 3145 2. Log on to the PingFederate application using the credentials you configured during installation.
- 3. On the **Main** menu under **SP CONNECTION**, click **Manage All SP**.
- 4. Click on the link for the WS-Federation connection to the SharePoint instance created in Section 3 (e.g., SharePoint).
 - 5. On the **Activation & Summary** screen, scroll down to the Assertion Creation group.

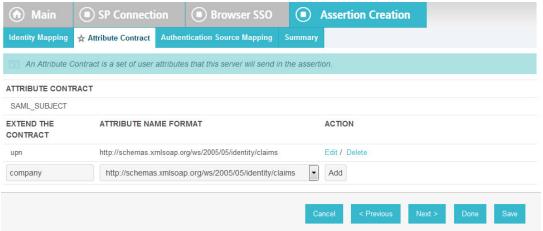

6. Click on the **ATTRIBUTE CONTRACT** link. On the Attribute Contract screen, under the EXTEND THE CONTRACT column, enter the name of the attribute (e.g., "company") to be passed from

3150 3151

3152

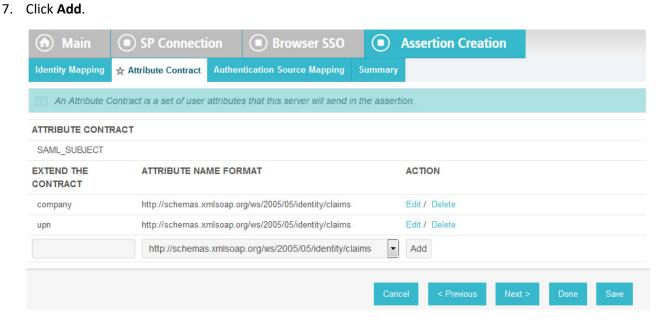

the PingFederate-RP to SharePoint in the empty text field. For the ATTRIBUTE NAME FORMAT, select the schemas.xmlsoap.org 2005 identity claims format.

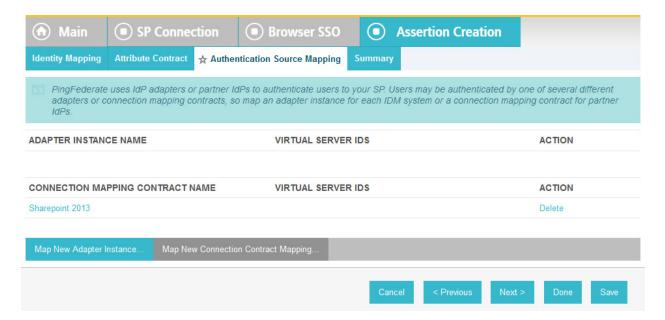

3155

3156

3157

3158 8. Click **Done**.

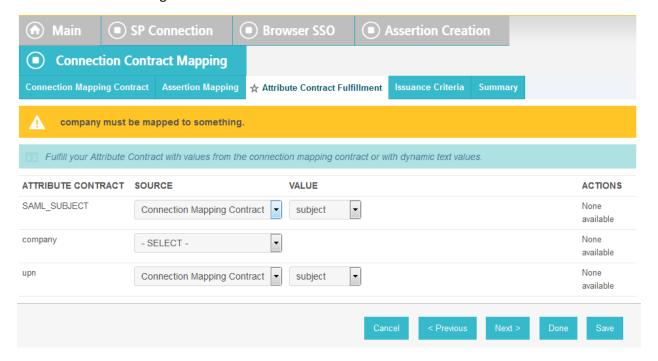

3160 3161

3162

3163

3164

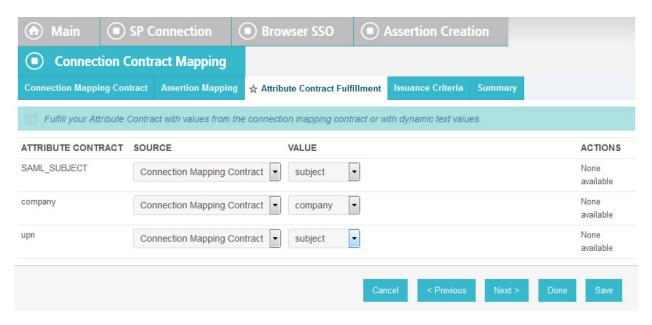

9. On the Authentication Source Mapping screen, under the CONNECTION MAPPING CONTRACT NAME heading, click on the name of the connection mapping contract (e.g., SharePoint 2013) between this PingFederate SP connection and the PingFederate IdP connection that was configured in the earlier section, Configure Relying Party to Pull Attributes from the Identity Provider's SAML Exchange.

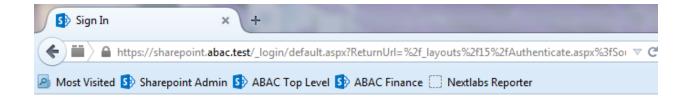

3165 3166

3167

10. On the Attribute Contract Fulfillment screen, for the "company" attribute, select Connection Mapping Contract for the SOURCE field. Select company for the VALUE field.

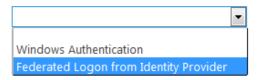

- 11. Click **Save** to complete the configuration.
- 3170 6.4.1.1 Functional Test of PingFederate-RP Passing Attributes to SharePoint
- The instructions in this section will help you perform a test to ensure that the PingFederate-RP is sending the correct attributes to SharePoint. The Firefox SAML tracer add-on is used to examine the SAML message.
- 1. Launch your Firefox browser and select **SAML tracer** from the Tools menu.
- This will launch an empty SAML tracer window. Minimize the SAML tracer window. The SAML tracer will automatically record the details of the HTTPS messages in the background.
- 2. Go back to the main browser window and go to the RP's SharePoint site (e.g., https://SharePoint.abac.test).

Sign In

Select the credentials you want to use to logon to this SharePoint site:

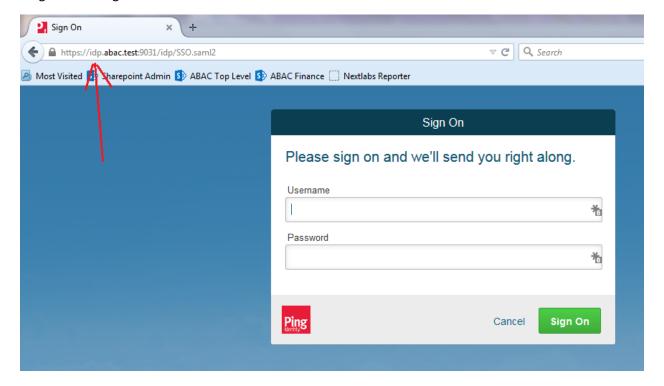

31793180

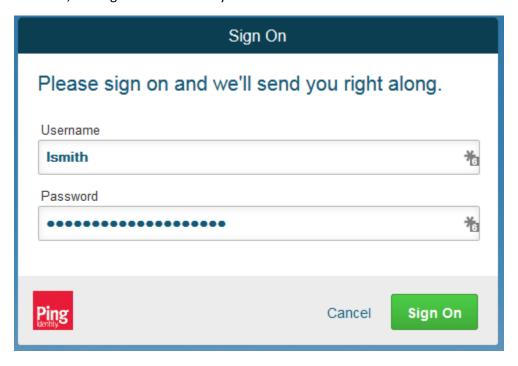

3181

3182

3. Select the option to use the federated logon (e.g., Federated Logon from Identity Provider). Your browser should be redirected to the PingFederate-IdP, and you should see the PingFederate Sign On screen.

4. Enter the Username and Password of the Microsoft AD account created earlier in this guide (e.g., Ismith). Note: If CISCO ISE has already been set up and 802.1x authentication has already occurred, this login is not necessary.

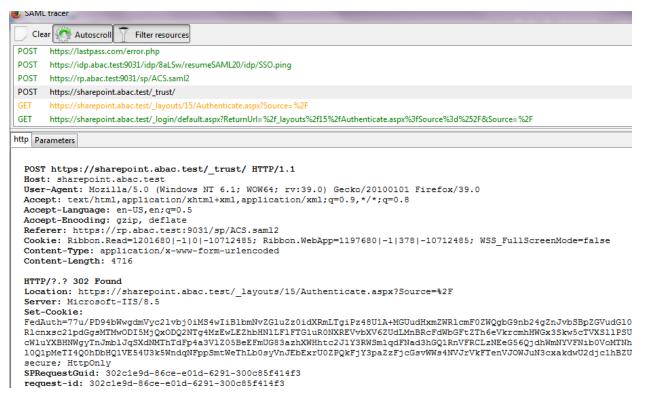

3187

3192

- 5. Click **Sign On**. On the RSA Adaptive Authentication screen, enter the SMS validation code received on your mobile phone. Click **Continue**.
- Once authenticated at the IdP, your browser should automatically redirect to the PingFederate-RP (e.g., *rp.abac.test*) and then to the RP's SharePoint (*SharePoint.abac.test*) site.
 - 6. Go back to the SAML tracer window. Scroll down the list of messages and click on the **POST** message to SharePoint trust URL to bring up the details of the message in the bottom pane.

3196 3197

3198

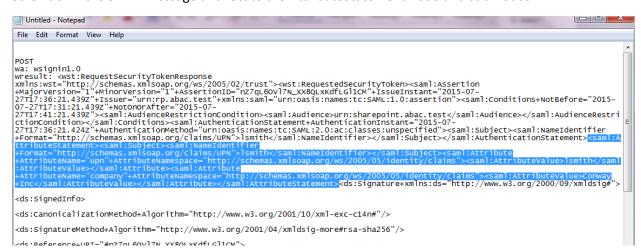

7. Click on the **Parameters** tab for the bottom pane.

8. Copy all of the content (beginning with the POST line) in the bottom page and paste it into a text editor such as Notepad. Turn on Word Wrap to make it easier to see all of the XML content.

3200

9. Scroll down the SAML message and locate the AttributeStatement node and sub-nodes.

3201 3202

3203

3204

10. For the AttributeStatement node and sub-nodes, enter some carriage returns before each XML tag to make it easier to examine the data. The goal is to be able to easily examine the Attribute nodes within the AttributeStatement node.

Expected Result: Within the AttributeStatement node, there should be multiple Attribute sub-

nodes. There should be an Attribute sub-node that has an AttributeName value of "company."

http://schemas.xmlsoap.org/ws/2005/05/identity/claims. There should be an AttributeValue

sub-node, which should contain the expected value (e.g., Conway Inc) for the "company"

3205

3206 3207

3208 3209 3210

3212 3213

3218

3214

3215 3216

3217

3219

3220 3221

3211

attribute that was pulled from Microsoft AD (e.g., <saml:AttributeValue> Conway+Inc </saml:AttributeValue>) for the specific user (e.g., Ismith) who authenticated at the Sign On screen.

6.4.2 Configure SharePoint to Read Custom Attributes from PingFederate-RP The PingFederate-RP will send attributes to SharePoint via WS-Federation. Follow the instructions below

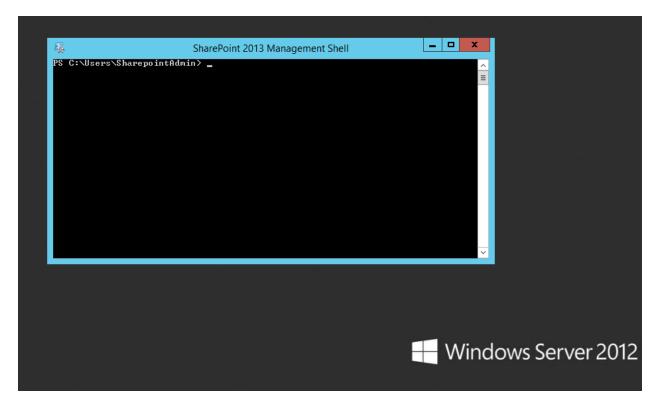

The AttributeNamespace value should be

to configure SharePoint to read the attributes and load them into the web session. In the example below, the attribute being configured to be read by SharePoint is the "company" attribute.

1. Using SharePoint administrator credentials, log on to the server that hosts SharePoint for the Relying Party.

2. Click on the Start menu and navigate to SharePoint 2013 Products group. Open SharePoint 2013 Management Shell.

NIST SP 1800-3C: Attribute Based Access Control

3. Enter each of the commands displayed below the next paragraph into the Management Shell to configure a new attribute, "company," for the existing Trusted Identity Token Issuer named "Federated Logon from Identity Provider," Enter each command separately, and enter a carriage return after the command. If the command executed successfully, Management Shell will not provide any feedback. If an error occurs, Management Shell will display the error.

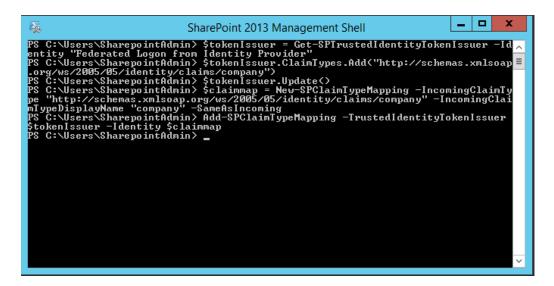

```
$tokenIssuer = Get-SPTrustedIdentityTokenIssuer -Identity "Federated Logon from
Identity Provider"

$tokenIssuer.ClaimTypes.Add("http://schemas.xmlsoap.org/ws/2005/05/identity/cla
ims/company")

$tokenIssuer.Update()

$claimmap = New-SPClaimTypeMapping -IncomingClaimType
"http://schemas.xmlsoap.org/ws/2005/05/identity/claims/company" -
IncomingClaimTypeDisplayName "company" -SameAsIncoming
```

4. Add-SPClaimTypeMapping -TrustedIdentityTokenIssuer \$tokenIssuer -Identity \$claimmap

3238

3241

3242

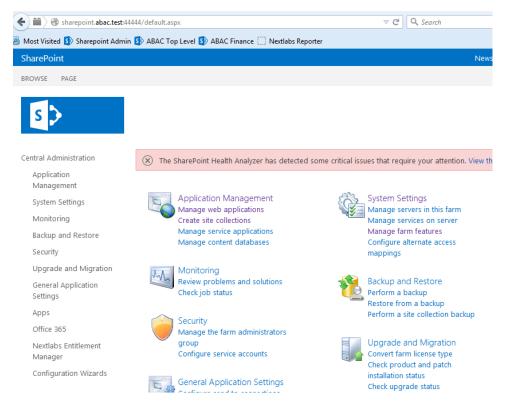

3243

3244

6.4.2.1 Functional Test of SharePoint Reading Attributes from PingFederate-RP

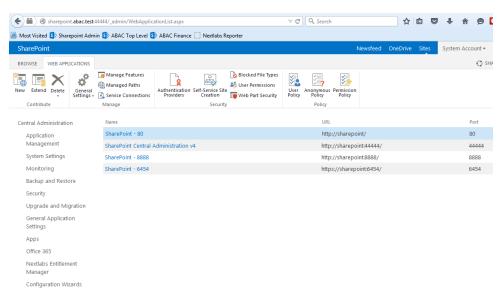

The instructions in this section will help you perform a test to ensure that SharePoint can read the attributes sent in messages from the PingFederate-RP.

- 1. First, follow the instructions in this section to ensure that SharePoint is configured to read the newly configured attributes from PingFederate-RP.
- 2. Launch your browser and go the SharePoint central administration page (e.g., http://SharePoint.abac.test:44444/default.aspx).
- 32. Log on using the credentials of the SharePoint administrator.

3247

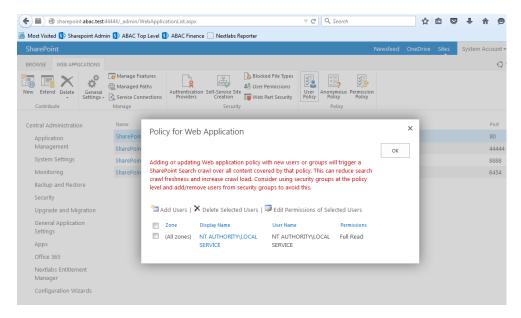

- 4. Under the Application Management group, click on Manage Web Applications.
- 5. Click on the web application that contains the SharePoint site you are managing (e.g., SharePoint 80). SharePoint highlights the web application row that you clicked.

3250

3251 6. Click **User Policy**.

SECOND DRAFT

3252

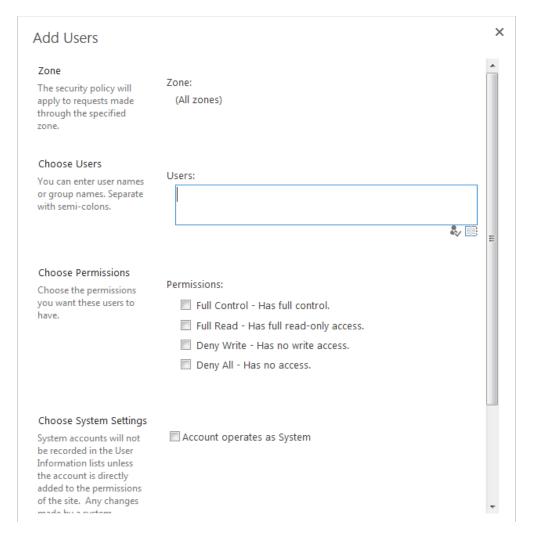

3253

Click the Add users link.

3254

3255 8. Click **Next**.

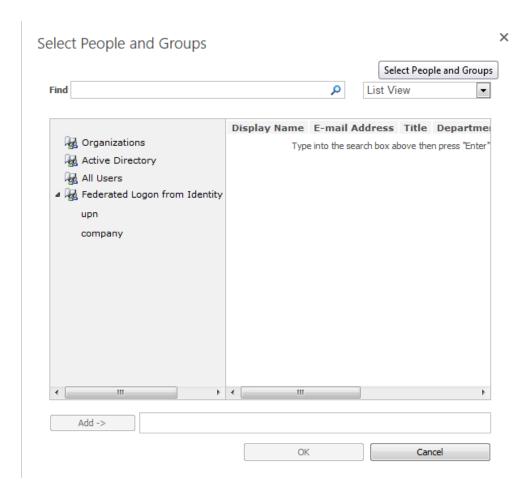

3257

3258

9. On the **Add Users** screen, click the small browse icon (looks like an open book) under the **Users** field.

325932603261

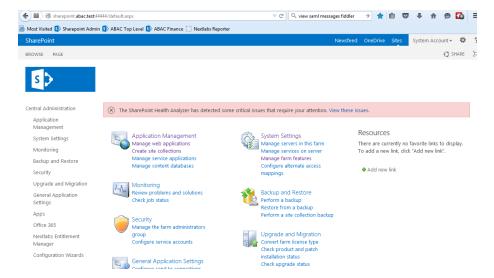

<u>Expected Result:</u> On the Select People and Groups screen, you should see a grouping with the name of the trusted token issuer (e.g., Federated Logon from Identity Provider). You should also see the newly configured attribute (e.g., company) listed under that grouping.

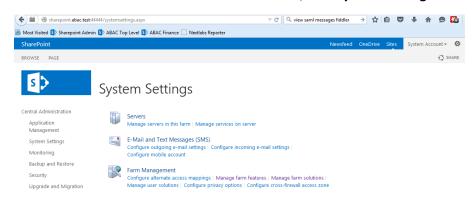

6.5 Configure the Claims Viewer Web Part at the SharePoint Site

Follow the instructions below to configure the Claims Viewer web part at the SharePoint site. The Claims Viewer is a component that is useful to the SharePoint administrator because it displays a list of the attributes that are loaded into the web session. This list can be used to validate that the correct set of attributes and associated values are being passed from the PingFederate-RP, and that SharePoint is correctly configured to read the attributes.

- 1. Log on to the server that hosts SharePoint for the RP.
- 2. Launch your browser and go the SharePoint central administration page (e.g., http://SharePoint.abac.test:44444/default.aspx). Log on using the credentials of the SharePoint administrator.
- 3273 The central administration home page displays.

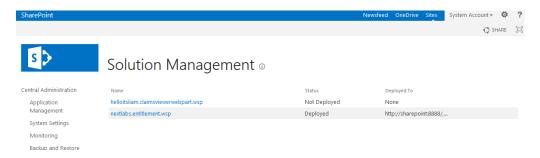

32. On the **Central Administration** menu on the left, click **System Settings**.

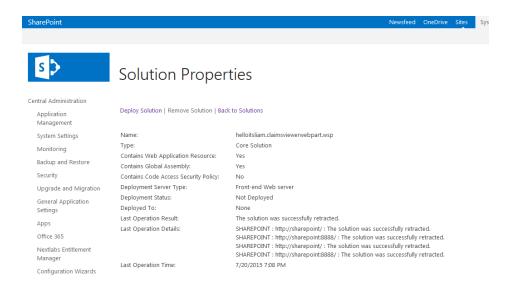

3276 3277

4. On the Farm Management menu, click Manage Farm Solutions.

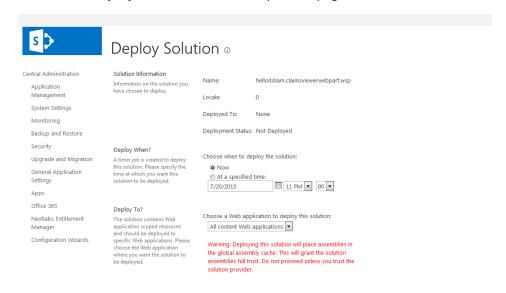

32783279

5. Click on the **helloitsliam.claimsviewerwebpart.wsp** link.

6. Click on the **Deploy Solution** link at the top of the page.

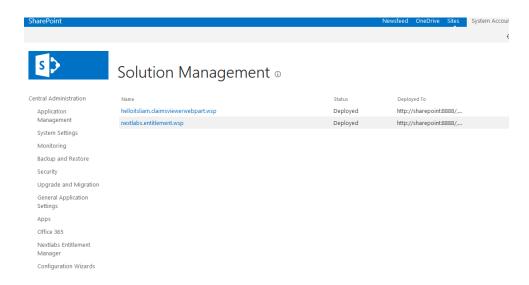

32823283

3284

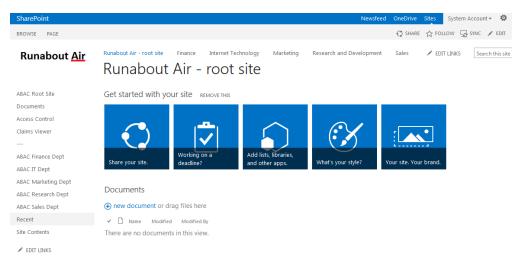

7. Click **OK** at the bottom of the page.

The claimsviewerwebpart should be shown as deployed on the Solution Management page.

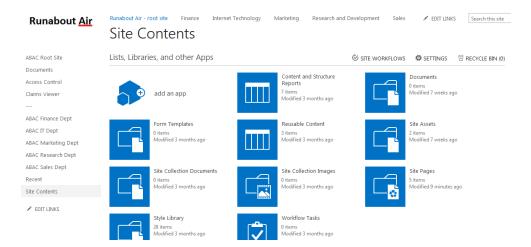

3287

- This completes the portion of the claims viewer web part configuration at the SharePoint central administration page.
- 3288 6.5.1.1 Configure SharePoint Claims Viewer
- 3289 This section explains how to add a new page to the SharePoint site to view the claims.
- 1. Log on to the RP's SharePoint site (e.g., https://SharePoint.abac.test) using the credentials of the SharePoint administrator. Select **Windows Authentication** at the Sign On screen.

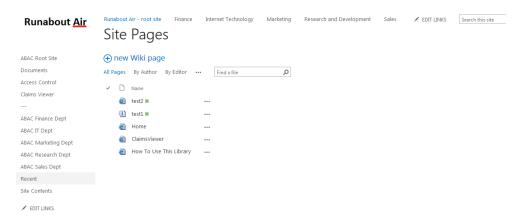

32923293

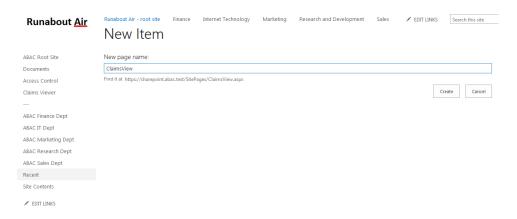

2. Click the gear icon at the top right corner of the page and select the **Site Contents** link.

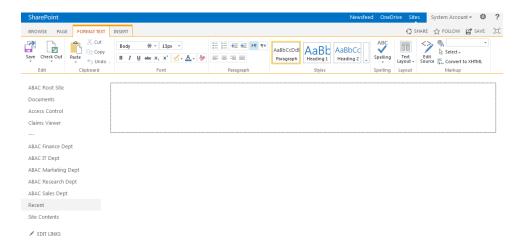

3. Click on the Site Pages library. This will show a list of the existing pages on the site.

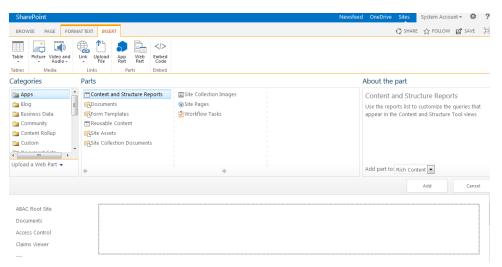

4. Click the new Wiki page link to add a new page. This link may be named differently, depending on your site's SharePoint template. Enter a name for the new page (e.g., ClaimsView).

5. Click **Create**. The SharePoint page editor for the newly added page displays.

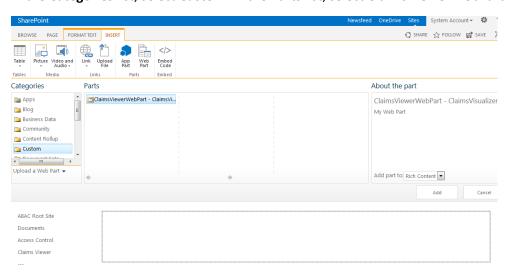

3302 6. Click on the **INSERT** tab at the top of the page. Click on the **Web Part** button.

3303 3304

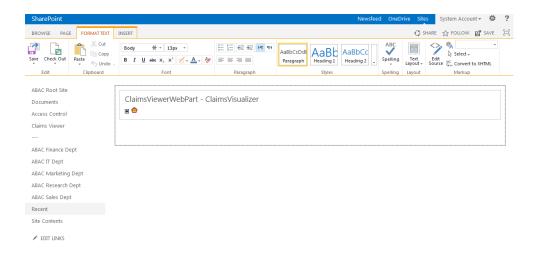

7. In the Categories list, select Custom. In the Parts list, select ClaimsViewerWebPart.

3305 3306

8. Click Add.

SECOND DRAFT

33073308

3309

3310

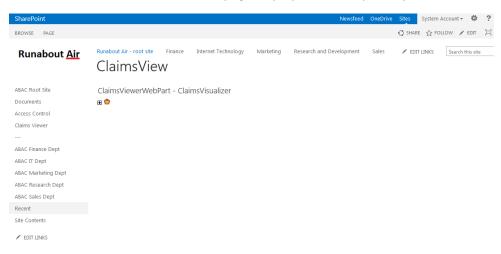

3311

3312

9. Click the **SAVE** button at the top right corner of the page.

SharePoint launches the new page (e.g., ClaimsView) that was just created. Save the URL of the new page (e.g., https://SharePoint.abac.test/SitePages/ClaimsView.aspx), because you will use it later in a functional test.)

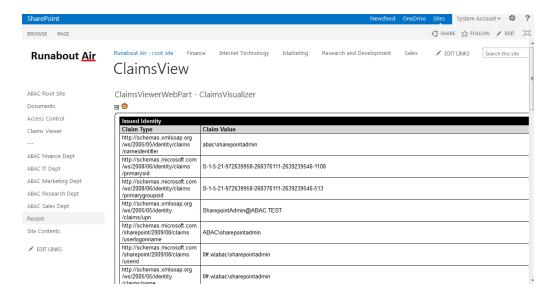

The Claims Viewer Web Part on the page displays. It is collapsed by default.

33133314

3315

10. Click on the + sign under **ClaimsViewerWebPart** to view the claims data. You will see a list of claim values and information about the SAML token at the bottom of the page.

3317

3322

6.6 Functional Test of All Configurations for Section 6

The instructions in this section will perform an integrated test all of the configurations in Section 6.
Using the browser, you will log on using an account that was created in Microsoft AD. Then you will use
the SharePoint claims viewer to validate that the newly configured attributes are passed from the IdP to
the RP and that the attributes are successfully loaded into the SharePoint web session.

1. Launch your browser and go to the RP's SharePoint site (e.g., https://SharePoint.abac.test).

Sign In

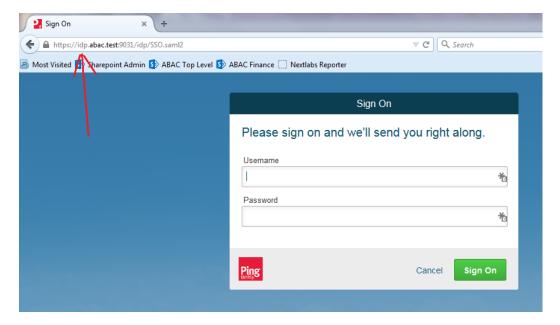

Select the credentials you want to use to logon to this SharePoint site:

33233324

3325 3326 2. Select Federated Logon from Identity Provider.

Your browser is redirected to the PingFederate-IdP, and you see the PingFederate Sign On screen.

3328

3. Enter the credentials of the Microsoft AD account created earlier in this guide (e.g., Ismith).

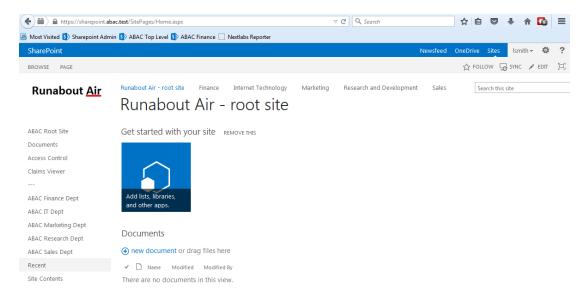

33293330

4. Click **Sign On**. On the **RSA Adaptive Authentication** screen, enter the SMS validation code received on your mobile phone. Then, click **Continue**.

3332 3333

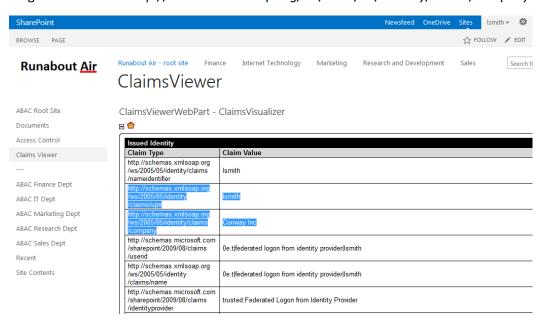

3331

Once authenticated at the IdP, your browser automatically redirects to the PingFederate-RP (e.g., rp.abac.test) and then to the RP's SharePoint (SharePoint.abac.test) site.

 Once you arrive at the SharePoint site home page, navigate to the claims viewer page that was created in the earlier section (e.g., https://SharePoint.abac.test/SitePages/ClaimsView.aspx).
 Expand the claims viewer web part on the page to see a list of claims.

<u>Expected Result:</u> You should see the newly configured attribute (e.g., **company**) and its associated claim value. The claims viewer shows the name of each attribute (i.e., **claim**) using a long format such as http://schemas.xmlsoap.org/ws/2005/05/identity/claims/company.

6.6.1 Temporarily Disable SAML Encryption for Testing and Troubleshooting Message Exchanges

Follow the instructions below to temporarily disable the encryption of SAML messages between the IdP and the RP. You should perform the steps in this section only when explicitly instructed to do so in another section of the guide (e.g., during a functional test). You may also need to refer back to this section in the future to test or troubleshoot SAML message exchanges in your environment.

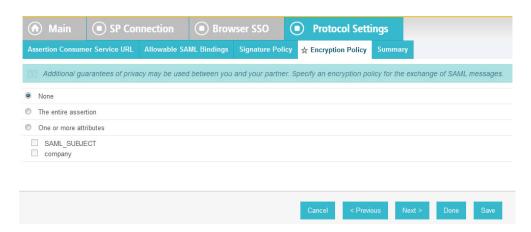

Temporarily disabling the encryption can help test that the expected attributes are being exchanged between the IdP and the RP. By temporarily disabling the encryption, you will be able to see the attributes and their associated values in the SAML messages using the Firefox SAML tracer add-on or a comparable software tool. When testing or troubleshooting is completed, you can enable the encryption again.

6.6.1.1 Disable SAML Encryption

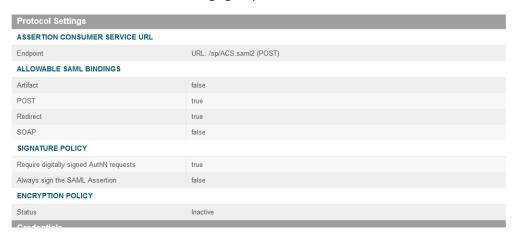

- 1. Launch your browser and go to <a href="https://<DNS_NAME>:9999/pingfederate/app">https://<DNS_NAME with the fully qualified name of the IdP's PingFederate server (e.g., https://idp.abac.test:9999/pingfederate/app). Log on to the PingFederate application using the credentials you configured during installation.
- 2. On the Main menu under SP CONNECTION, click Manage All SP.
- 3. Click on the link for the SP connection for which you want to disable the encryption (e.g., https://rp.abac.test:9031).
 - 4. Scroll down to the **Protocol Settings** group.

- 3363 5. Click on the **ENCRYPTION POLICY** link.
- 6. On the **Encryption Policy** screen, select **None**.

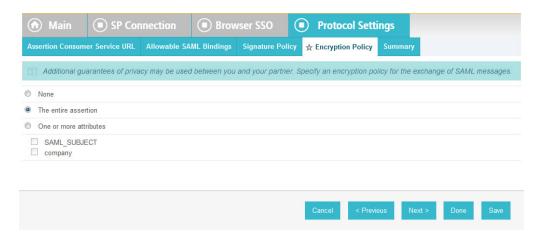

- Click Save.
- At this point, you have disabled SAML encryption at the IdP for this specific connection to the RP. You can perform authentication testing using the Firefox SAML tracer to examine the SAML messages being sent by the IdP to the RP.
- 3370 6.6.1.2 Enable SAML Encryption again
- Once testing is completed, follow the instructions below to enable the encryption once again.
- 1. On the PingFederate Main Menu under SP CONNECTION, click Manage All SP.
- 2. Click on the link for the SP connection for which you want to enable the encryption (e.g., https://rp.abac.test:9031).
- 3. Scroll down to the Protocol Settings group.

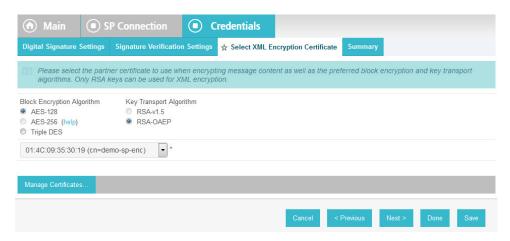

33763377

- 4. Click on the **ENCRYPTION POLICY** link.
- 5. On the **Encryption Policy** screen, select **The entire assertion**.

- Click Save.
- On the Select XML Encryption Certificate screen, select the Block Encryption Algorithm (e.g., 3382
 AES-128), and the Key Transport Algorithm (e.g., RSA-OAEP). For the selection box above
 Manage Certificates, select the RP's public key certificate to be used to encrypt the message content.

3385

3386

3388

3389

3390

3391

3392

3393

3394

3395

3396

- 8. Click Save.
- You have now enabled the encryption for the connection again.

7 Setting Up NextLabs to Protect SharePoint

7.1 Introduction

In this build we are using an ABAC architecture to protect resources on a Microsoft SharePoint instance. In this section, we will install the NextLabs Control Center, Policy Studio, Policy Controller, and Entitlement Manager for SharePoint Server. Before getting started installing these components, you must prepare your environment. At a minimum, Windows Server 2012 must be set up with a configured Active Directory, and SharePoint must be installed and configured with a Site Collection. If you haven't already completed the basic installation and configuration of Windows Server 2012 and Active Directory, please refer back to Section 2, "Setting up the Identity Provider." If you haven't already

SECOND DRAFT

- completed the installation and configuration of SharePoint, please refer to <u>Section 4</u>, "Installing and Configuring Microsoft SharePoint Server and Related Components."
- 3399 The four NextLabs components installed in this How-To section provide an Information Control Platform
- 3400 (ICP), Policy Administration Point (PAP), Policy Decision Point (PDP), and Policy Enforcement Point (PEP)
- in the ABAC Architecture. Each component will be described generally in the Components section. Then
- there will be separate sections illustrating installation and configuration of each component. Finally, the
- 3403 Functional Test section will give some guidance for verifying the correct installation and configuration of
- 3404 the various components presented in this section.

7.2 Components

3405

3406 3407

3409

3410

3411

3412

3413

3414

3415

3416

3417

- NextLabs Control Center (release 7.5): enterprise-level Information Control Platform (ICP) for policy-driven data loss prevention and entitlement management; can contain many software components, including the following two in this build:
 - **Policy Studio: Enterprise Edition (PAP):** application for policy lifecycle management, provides a graphical user interface (GUI) for defining and deploying ABAC policies. This product is installed on an instance of SQL Server.
 - **Policy Controller (PDP):** distributed component of the Control Center that evaluates policies created in the PAP to determine a deny or allow decision when users attempt to access protected resources. This product is installed on an instance of Microsoft SharePoint Server.
- NextLabs Entitlement Manager for Microsoft SharePoint Server (PEP): enforces the decisions
 from the PDP to deny or allow access to SharePoint resources. this product is installed on an
 instance of Microsoft SharePoint Server.

3418 7.2.1 NextLabs Control Center (release 7.5)

- 3419 The NextLabs Control Center is an enterprise-level Information Control Platform (ICP). It integrates into
- 3420 existing IT infrastructure, and applications and can be used to digitally manage policies to govern data
- 3421 classification, access, sharing, and automate security compliance procedures. In order to fulfill its diverse
- 3422 capabilities, the Control Center can be configured to incorporate and coordinate many NextLabs
- 3423 software components. It is also possible to develop your own custom access control enforcers for
- 3424 applications that do not already have an available enforcer built by NextLabs. In this build, we take
- 3425 advantage of the Policy Studio, Policy Controller, and Entitlement Manager for Microsoft SharePoint
- 3426 Server, which are discussed in the following sub-sections.
- 3427 In order to support administrative and configuration activities necessary for its many components,
- 3428 NextLabs Control Center provides a web application user interface called Administrator. Some of the
- 3429 system monitoring and administrative tasks available via Administrator include: checking how many
- 3430 policies are deployed in the network, finding out on which hosts the Control Center components are
- installed, checking the status of Control Center server components, finding out how many enforcers are
- 3432 currently running, finding out if any enforcers are disconnected, and finding out or modifying the
- 3433 current heartbeat setting for an enforcer, among others.
- 3434 Another key component of the Control Center is the Policy Server. The Policy Server runs continuously
- from the moment of startup as a Windows service. As new policy is defined or policies are updated, the
- Policy Server pushes these policy sets to the Policy Controller on the SharePoint Server.

The Control Center platform is installed and configured on the same server as the build's SQL database, which we refer to as the SQL Server.

7.2.2 NextLabs Policy Studio: Enterprise Edition

- 3440 The NextLabs Policy Studio component of the Control Center is intended for administrators and policy
- 3441 designers responsible for converting the general data access and usage management goals of the
- enterprise into deployable, active policies. Depending on a company's business rules, policies can be
- defined to evaluate user (subject) attributes, resource (object) attributes, and environmental
- 3444 (contextual) attributes.

3467

3468

3469

3470

3471

3472

3473

3474

3475

- 3445 The Policy Studio provides a graphical user interface with which you can create an abstract model
- representing the various parts of the enterprise environment (users, applications, computers, and
- 3447 environmental context), construct policies with these modeled components, and fine-tune policies using
- 3448 advanced conditions that can change based on dynamic comparisons, evaluations, and contextual
- factors. For example, policy designers can select pre-defined conditions including the time of day, day of
- 3450 the week, connection type, and IP address, among many others. In addition to defining which attributes
- 3451 to evaluate when making an enforcement decision, the policy construction process can also determine
- notification obligations such that when a policy is allowed or denied, a user can be notified with a
- default or custom message, a statement can be added to the application's log file, and an email can be
- 3454 sent to an administrator.
- Like the Control Center platform, the Policy Studio is installed and configured on the SQL Server.

3456 7.2.3 NextLabs Policy Controller

- 3457 Each NextLabs Policy Controller provides the interface to the Policy Server component of the Control
- 3458 Center (installed on the SQL Server), and serves as a distributed Policy Decision Point (PDP). It comprises
- 3459 a set of software modules delivered with Control Center, read-to-install on the enforcer host or
- 3460 development machine. Because it is not specific to any adapter type, it requires no customization. In this
- build, the Policy Controller is installed and configured on the same server as the SharePoint instance,
- which we refer to as the SharePoint Sever.
- 3463 In general, the logical architecture of a NextLabs enforcer that protects an application (such as the
- 3464 Entitlement Manager for SharePoint Server, covered in the next sub-section) consists of two parts, the
- 3465 Policy Controller and the Policy Adapter.
- 3466 The Policy Controller consists of the following functional components:
 - The Policy Evaluation Engine evaluates whether or not each user action is covered by any of the policies currently cached at that enforcement point. It bases its evaluation on multiple criteria such as who the user is, what host he is using, how he is connected to the network, which action is being attempted, on what resource, the date, the time, and so on. It does this in real time, and operates continuously whether the host is connected to the network or not. Note that while disconnected from the network the local encrypted bundle.bin policy cache would not be able to be updated from policy changes made in the PAP.
 - <u>Note</u>: Policies are authored in the PAP GUI on the SQL Server, and any modifications to the policy set are transmitted by the Policy Server, also installed on the SQL Server, to the Policy

Controller on the SharePoint Server. It takes a heartbeat length of time for the updates to take effect on the SharePoint Server. By default, the heartbeat rate of the desktop enforcer is set to 60 minutes, which is appropriate for a live production environment. For testing and learning purposes, however, you should change this to 1 minute, which will allow you to define, deploy and test policies with shorter delays. A heartbeat can be configured via the Control Center Administrator web application.

- The Context Manager keeps constant track of the environmental context of all events, and provides it to the Policy Engine and Policy Adapter. The context includes user identity, computer host name, network connection type, and date and time.
- For any policy that evaluates as True, the **Obligation Manager** initiates an obligation by sending a request to a policy adapter's obligation services or executing built-in obligations. It contains three sub-components:
 - Policy Logger collects and logs all activity details and policy decision results
 - Messaging Services sends message to recipients or targets listed in a policy
 - Application Extender launches an application or custom executable that performs some custom obligation
- The Controller Manager records non-policy activities, updates the configuration, and secures the controller. Components include:
 - Activity Recorder records activities tracked by the policy adapter in real time.
 - Configuration Manager applies profile and system configuration changes in real time
 - Policy Authentication authenticates the policy set from the Policy Server and encrypts it on the local file system
 - <u>Note</u>: It is the responsibility of the Controller Manager to encrypt the bundle.bin file on the local file system for use during policy evaluation by the PDP.
 - Tamper Resistance Module protects all Entitlement Manager processes, installed files, and registry settings from tampering by users or other processes, and governs the automatic start-up and restart features. The Policy Controller runs as a Windows service continuously from the moment of startup, called Control Center Enforcer Service.
- The ICENet Client provides the interface for all communication with the Policy Server. It is used
 for deploying new or changed policies, periodically sending activity logs from each control point,
 and providing controller health status.

7.2.4 NextLabs Entitlement Manager for Microsoft SharePoint Server

The NextLabs Entitlement Manager for SharePoint is designed to enforce the policies that control whether and how users can access, download, and use data stored on a SharePoint server. SharePoint policies can apply to entire portals or to any parts thereof, and allow some users to view all webparts on a page while blocking other users from viewing some subset of the webparts on the same page.

3531

3532

- Regarding installation of Microsoft SQLServer 2012: if you already completed the <u>Section 4</u>, "Installing and Configuring Microsoft SharePoint Server and Related Components," this step will already have been completed.
 - 2. Regarding having a database dedicated to NextLabs: NextLabs recommends that for anything but a demo or testing environment, you should use a database running on its own dedicated server to store all system data, rather than rely on Control Center's internal database. A dedicated database server is strongly recommended because policy enforcement data accumulates quickly and can reach a significant volume. The problem is not necessarily storage space, but the performance drag on other processes caused by database queries of large amounts of data.
- 7.3.1.2 Create a New Database and Database User for the NextLabs Control Center Installation and Administration
 - 1. Open Microsoft SQL Server Management Studio and login to Microsoft SQL Server.

2. Right-click on **Databases**, left-click on **New Database**.

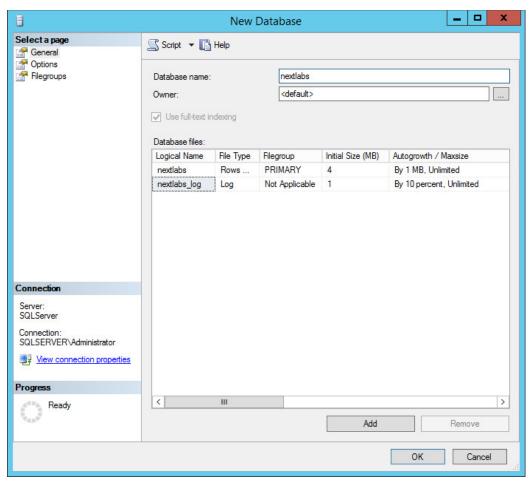

3535

3. In the New Database window, specify a **Database name** that works for you. The application automatically copies this into the **Logical Name**s of the **Database files**. Click **OK**. Example name from this build: **nextlabs**

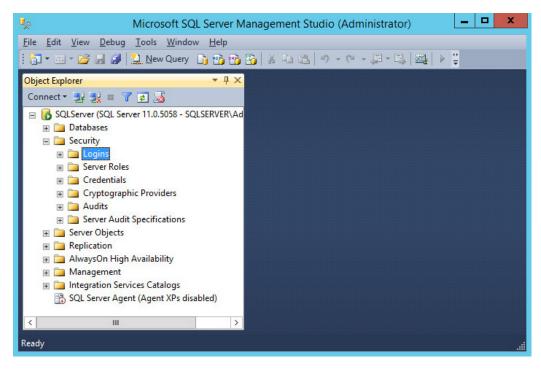

3536 3537

3538

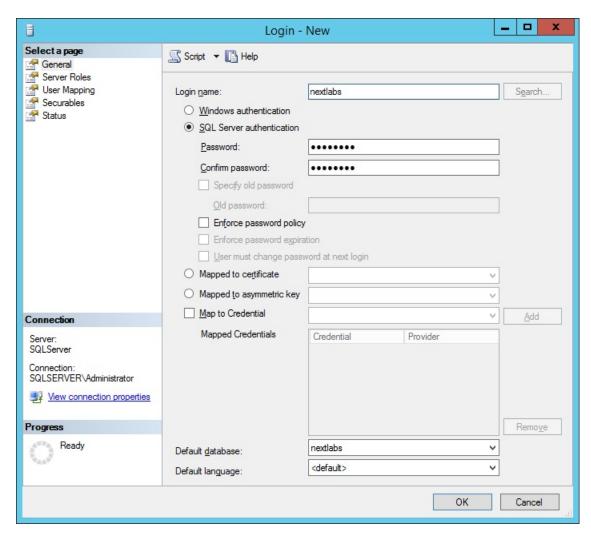

3541

4. Click on the menu box next to **Security** to begin the process for creating a new login for the new NextLabs database's administrator.

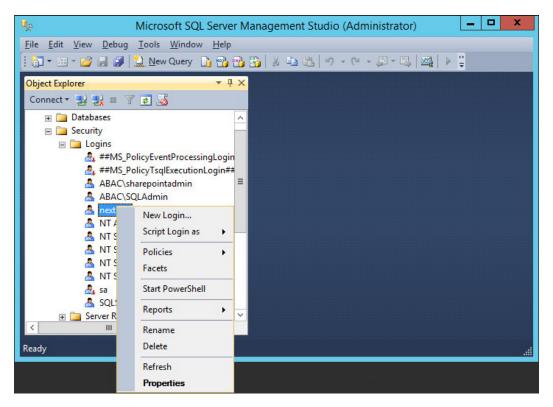

- 5. Right-click **Logins**. Left-click **New Login**.
- 6. Click on **SQL Server authentication**, and enter a new **Login name** and **Password**.

3546

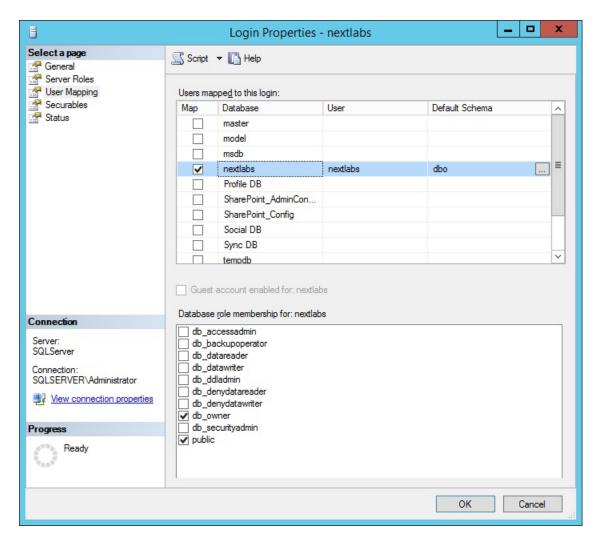

3547

7. Click the menu box next to **Logins**. Right-click on the new user created in the previous step. Click **Properties**.

3550

8. Click on **User Mapping**, then **New Database**. Under **Database role membership for:** [database_name], check the box next to db_owner.

3560

3561

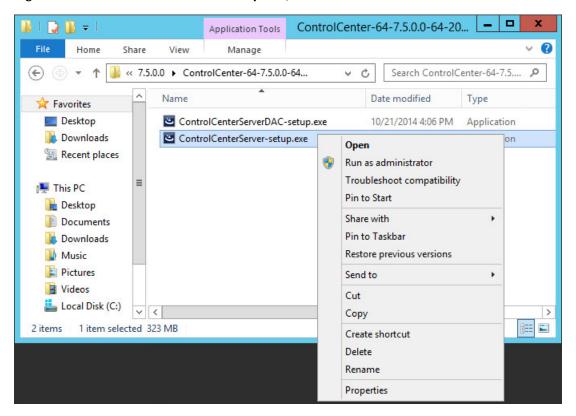

7.3.1.3 Install and Configure the NextLabs Control Center

- Complete standard Control Center installation per NextLabs documentation available to customers, using the following steps:
 - 1. Go to your Desktop or other known location where the required NextLabs Control Center installation files are stored. Example:
 - C:\Users\Administrator\Desktop\NextLabs\Platform\7.5.0.0\
 - Note the location of the required license.dat file which will be needed later; example:
- 3559 C:\Users\Administrator\Desktop\NextLabs\Platform\License\license.dat
 - 2. Right-click on **ControlCenter-64-7.5.0.0-64-201410211146.**zip and select **Extract All** from the floating menu. Wait for the files to be extracted.
- 35. Double-click to open the **ControlCenter-64-7.5.0.0-64-201410211146** folder.

3564

4. Right-click on **ControlCenterServer-setup.exe**, and select **Run as administrator**.

3565 3566

5. Click Next.

3568

6. Select I accept the terms in the license agreement, then click Next.

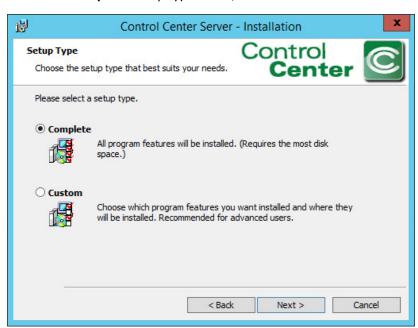

3569

3570

Click Next.

3572 8. Select the **Complete** setup type. Then, click **Next**.

35733574

9. Enter the location of the license file in the **License File Location** field, or click **Change** to navigate to its location in Windows File Explorer. Click **Next**.

3576 3577

3575

Example location: $C:\Users\Administrators\Desktop\Platform\7.5.0.0\ ControlCenter-64-7.5.0.0-64-201410211146\license.dat$

10. In the configuration wizard Super User password screen, enter a **Password** for the built-in administrative user for all Control Center Server applications. Click **Next**.

11. At the SSL Certificate Password screen, enter a **Password** to access the SSL certificates for the Control Center Server. Click **Next**.

3586

12. At the Encryption Key Store Password screen, enter a **Password** to access the Encryption Key Store for the Control Center Server. Click **Next**.

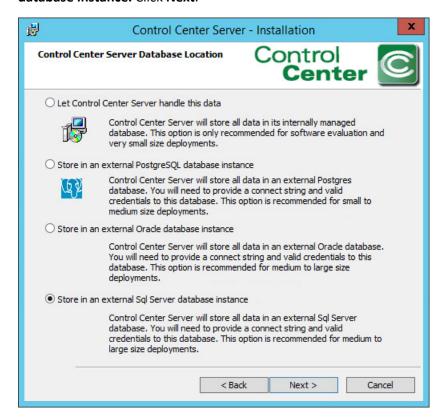

3587 3588

13. At the Application User Authentication screen, click Skip.

14. At the Control Center Server Database Location screen, select Store in an external **Sql Server** database instance. Click **Next**.

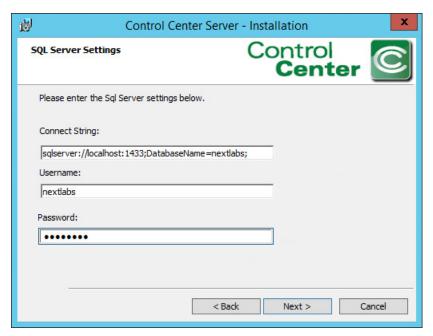

15. At the SQL Server Settings screen, do the following:

 a. Specify the **Connect String**, including the name of the new SQL database created. Example: **nextlabs**

b. Specify Username (non-Super User) and Password.

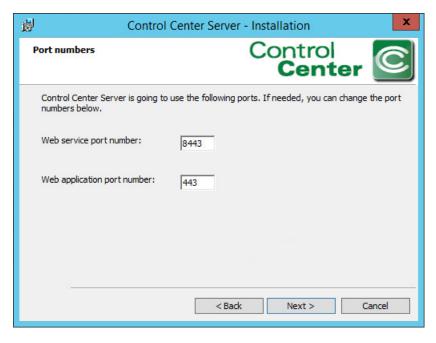

3597 3598 c. Click **Next**. Note: If the error **Connection to the SQL database could not be established properly** appears, it may help to restart the SQL Server.

3599 3600

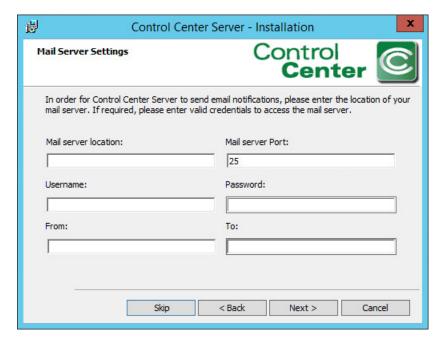

3601

16. At the Port numbers window, the default port numbers are already entered: Web service port number: 8443, Web application port number: 443. Click **Next**.

3602 3603

17. At the Mail Server Settings screen, click **Skip**.

3605 18. At the Ready to Install the Program screen, click Install.

3606 3607

19. At the Installation Wizard Completed screen, click Finish.

3610

3611

3612

3613

- 20. Open an Internet browser and navigate to the following URL: https://localhost/administrator to login to the Control Center Administrator web application.
 - a. If a security certificate warning comes up, click Continue to this website.
 - b. Enter the Administrator (Super User) **Username** and **Password**.
 - c. Click Login.

- 3616 3617
- 3618
- 3619
- 3620
- 3621
- 3622
- 3623
- 3624
- 3625 3626

3627 3628

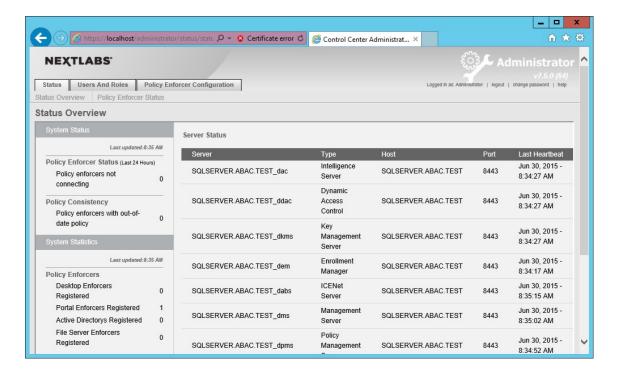

3629

3630

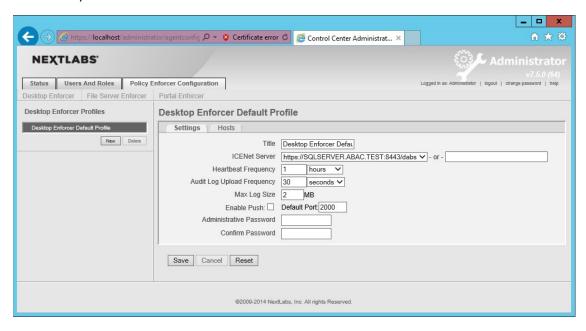

- 21. Once logged into the Control Center Administrator web application in your browser, you can verify that the NextLabs Control Center is installed and configured correctly on the SQL Server, and view the following information:
 - a. Fully qualified domain name (FQDN) of the server hosting the NextLabs Control Center. Example: **SQLServer.ABAC.TEST**
 - b. Services running on the host server, including but not limited to:
 - i. Intelligence Server
 - ii. Dynamic Access Control
 - iii. Key Management Server
 - iv. Management Server
 - v. Policy Management Server

For more information about these or other services running continuously via NextLabs Control Center on the SQL Server, please refer to NextLabs support documentation.

- c. Port via which the above services are running. Example: 8443, default for web services
- d. For each of the listed services, the default heartbeat period is 60 minutes, and can be modified via the Administrator (See step 23).

 22. Click on the **Policy Enforcer Configuration** tab. The default Profile to open is the **Desktop Enforcer Portal**, with the **Settings** sub-tab defaulted also open. To change the heartbeat frequency for testing or debugging purposes, edit the **Heartbeat Frequency** field (minimum time is 1 minute). Click **Save**.

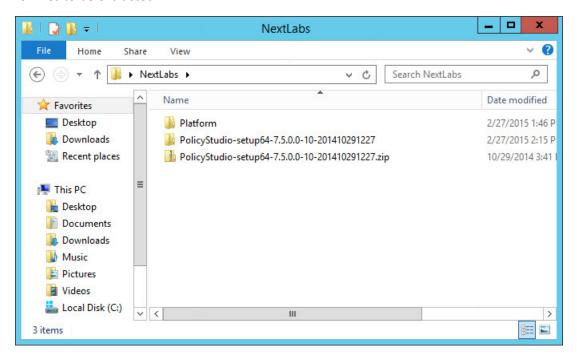

3638

3642

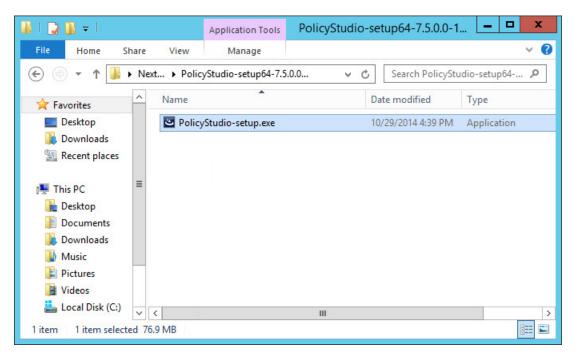

3643

7.4 Installation and Configuration of NextLabs Policy Studio: Enterprise Edition (PAP)

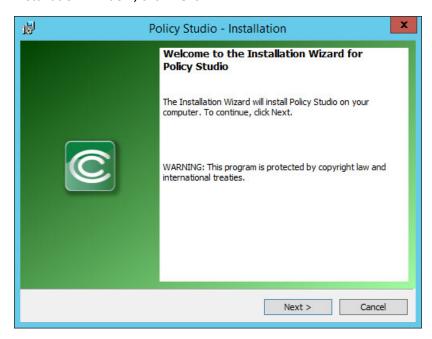

- 3639 7.4.1 Installation
- Complete the standard Policy Studio installation per NextLabs documentation available to customers using the following steps:
 - 1. On the SQLServer, go to your Desktop or other known location where the required NextLabs Policy Studio installation files are stored. Example: C:\Users\Administrator\Desktop\NextLabs\
- 2. Right-click on **PolicyStudio-setup64-7.5.0.0-10-201410291227.zip** and select **Extract All**. Wait for files to be extracted.

- 3646
- 3. Double-click to open the **PolicyStudio-setup64-7.5.0.0-10-201410291227** folder.
- 3648 4. Right-click on **PolicyStudio-setup.exe** and select Run as **Administrator**.

3650 3651 5. At the Welcome to the Installation Wizard for Policy Studio screen of the Policy Studio Installation Window, click **Next**.

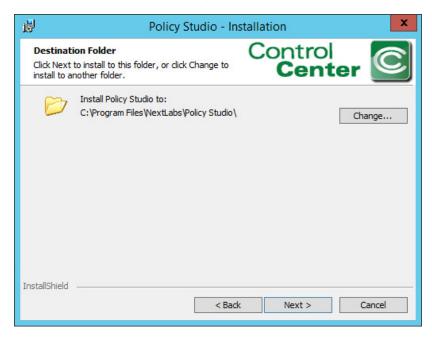

36523653

3654

6. At the License Agreement screen, select I accept the terms in the license agreement, and click Next.

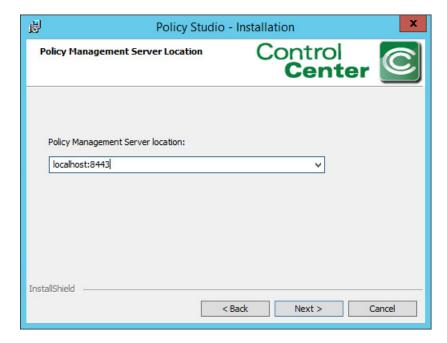

3656 7. At the Destination Folder screen, click **Next**.

36573658

3659

8. At the Policy Management Server Location screen, enter the default location **localhost:8443**. Click **Next**.

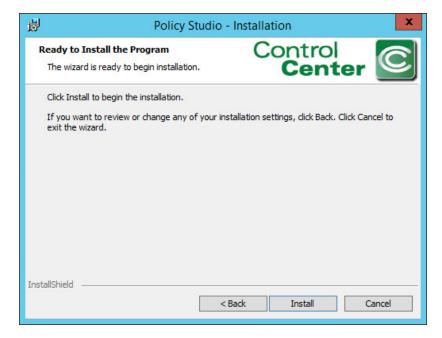

9. At the Policy Author Key Store Password screen, enter a **Password** and click **Next**.

3662

3663

10. At the Ready to Install the Program screen, click Install.

11. At the Installation Wizard Completed screen, click **Finish**.

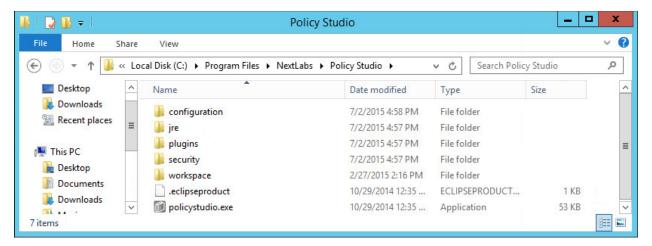

36663667

3669

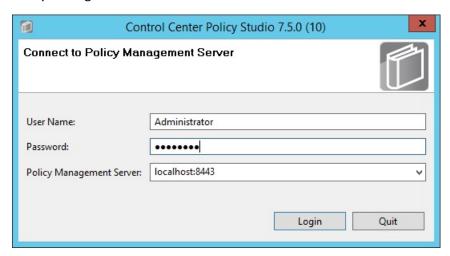

3670

- 12. In Windows Explorer, find and open the **policystudio.exe** application file.
- 3668 a. Double-click the **C:/ drive.**
 - b. Double-click Program Files.
 - c. Double-click NextLabs.
 - d. Double-click Policy Studio.
- e. Double-click policystudio.exe.

3675

13. In the Control Center Policy Studio window, enter a **User Name** and **Password** to connect to the Policy Management Server

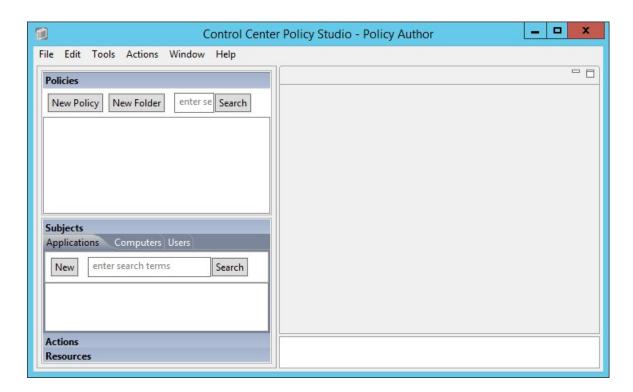

3676 3677

- 14. If the connection is successful, the Control Center Policy Studio Policy Author window will open.
- 3679

3678

a. Policies are defined and deployed in this interface, to be covered in Section 8.

3681

3688 3689

Installation and Configuration of Policy Controller (PDP) 7.5

7.5.1 Installation 3682

- 3683 To complete standard Policy Controller installation per NextLabs documentation available to customers, 3684 use the following steps:
- 3685 1. On the SharePoint Server, go to your Desktop or other known location where the required 3686 NextLabs Policy Controller installation files are stored. Example: 3687
 - C:\Users\Administrator\Desktop\SharePoint\
 - 2. Right-click on PolicyController-CE-64-7.0.1.0-1-201405191624.zip and select Extract All from the floating menu. Wait for files to be extracted.
- 3690 3. Double-click on PolicyController-CE-64-7.0.1.0-1-201405191624 folder to open it.
- 3691 4. Double-click **CE-PolicyController-setup64.msi** to begin installation.
- 3692 5. At the Welcome to the InstallShield Wizard for NextLabs Policy Controller Installation screen, 3693 click Next.

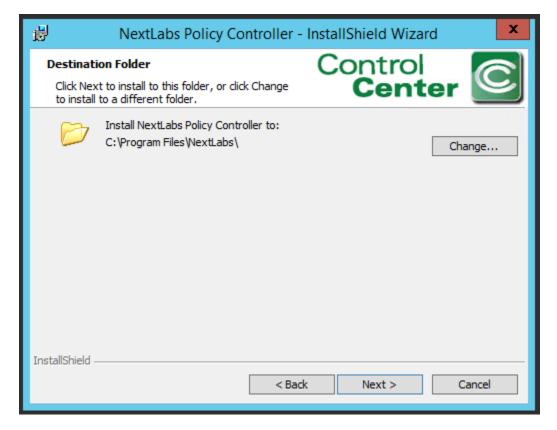

3695 3696 6. At the License Agreement screen, select I accept the terms in the license agreement and click Next.

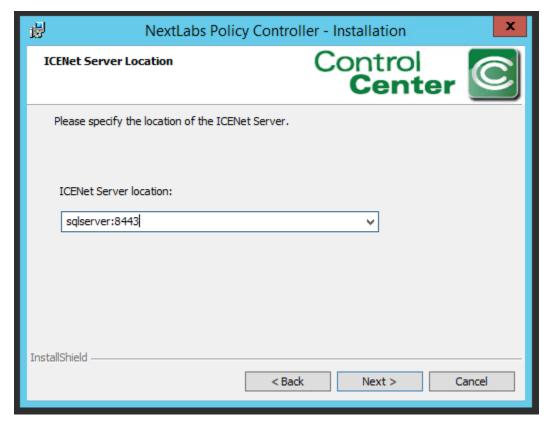

3698

7. At the Destination Folder screen, click **Next**.

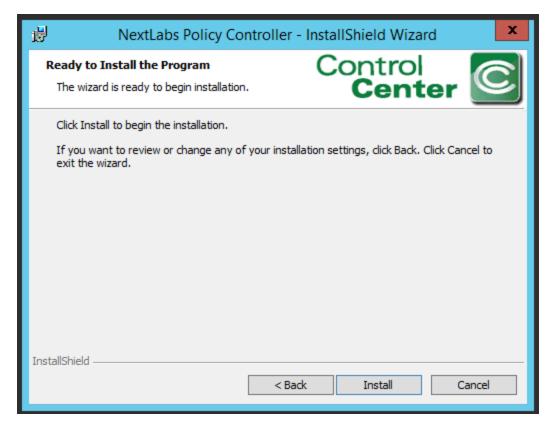

3700 8. At the ICENet Server Location screen, enter the default ICENet Server Location: **sqlserver:8443**. 3701 Click **Next**.

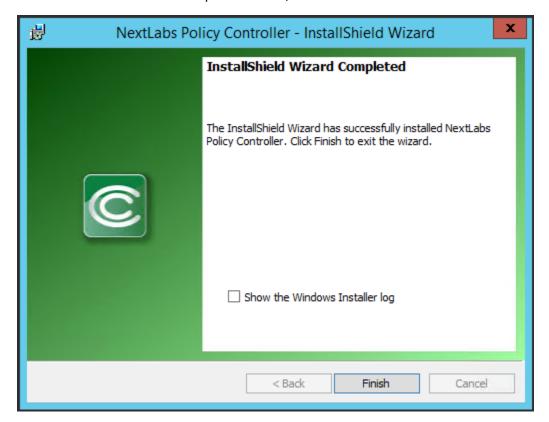

37023703

9. At the Ready to Install the Program screen, click **Install**.

3705

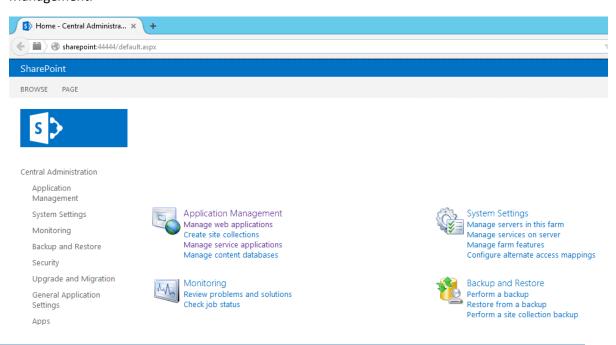

10. At the InstallShield Wizard Completed screen, click Finish.

- 11. In the window that immediately opens, click **Yes** to restart the computer, or click **No** to wait and restart after installing the PEP (see Section 7.6).
- 7.6 Installation and Configuration of NextLabs Entitlement Manager for
 SharePoint Server
- 3711 7.6.1 Installation and Configuration
- Note: Prior to installing the Entitlement Manager for SharePoint Server, it is necessary to install the
- 3713 NextLabs Policy Controller on the SharePoint Server. If you have not already installed the Policy
- 3714 Controller, please refer to Section 7.5 before proceeding.
- 3715 7.6.1.1 Verify that a Web Application Site and Site Collection Already Exist in SharePoint
- 1. On the SharePoint Server, open an Internet browser and navigate to the following URL: http://sharepoint:44444 to login to the SharePoint Central Administration portal.
 - 2. Enter the **User Name** and **Password** for your SharePoint Central Administration account, and click **OK**.

3721 3. At the Central Administration page, click on **Manage web applications** under Application 3722 Management.

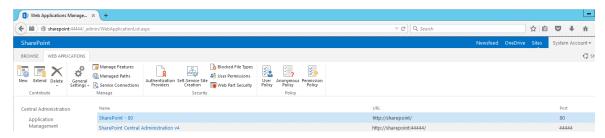

3723

3718

3719

a. If they do not already exist, create a default **Web Application** site and add it to a basic Site Collection in SharePoint via Central Administration (See Section 4).

3726

3727

3733

3734

3735

7.6.1.2 Install NextLabs Entitlement Manager for SharePoint Server

- Complete the standard Entitlement Manager for SharePoint Server installation per NextLabs documentation available to customers using the following steps:
- On the SharePoint Server, go to your Desktop or other known location where the required
 NextLabs Policy Controller installation files are stored. Example:
 C:\Users\Administrator\Desktop\SharePoint\
 - 2. Right-click on **SharePointEnforcer-2013-64-7.1.3.0-7-201410101427.zip** and select **Extract All** from the floating menu. Wait for the files to be extracted.
 - 3. Double-click on the SharePointEnforcer-2013-64-7.1.3.0-7-201410101427 folder.
- 4. Double-click on **SharePointEnforcer-2013-64-7.1.3.0-7.msi** to begin the installation.
- 3737
 5. At the Welcome to the InstallShield Wizard for NextLabs Entitlement Manager for MicroSoft
 3738
 SharePoint screen, click Next.

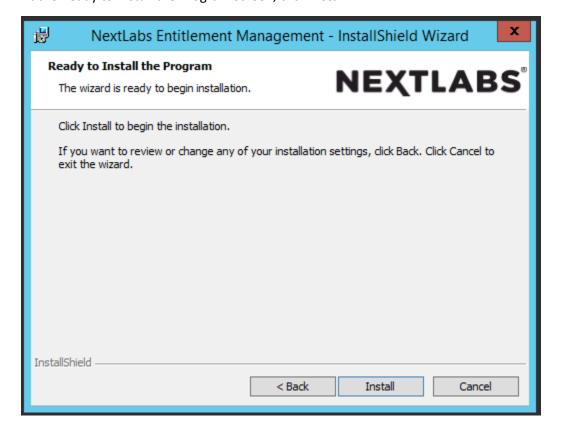

3741

6. At the License Agreement screen, select I accept the terms in the license agreement and click Next.

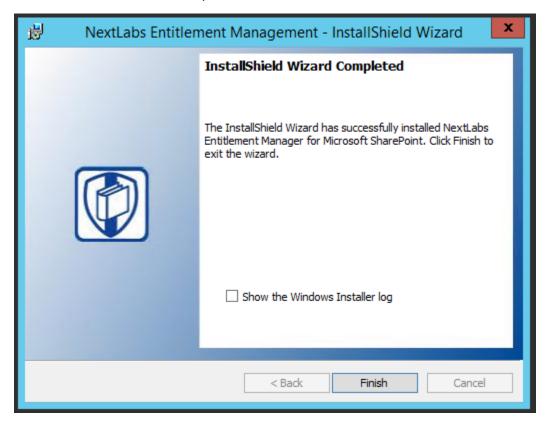

3743

7. At the Ready to Install the Program screen, click Install.

3745 8. At the InstallShield Wizard Completed screen, click **Finish**.

3746

3747

3748

3749

3750

3751

3752

3753

3754

3755

3756

- 9. After installing the IIS server must be reset:
 - a. Click on the Windows icon and begin typing the word PowerShell
 - b. When the Windows PowerShell application icon appears, double-click on the icon to open the Windows PowerShell
 - c. From within the Windows PowerShell window, type in this command and press Enter to reset Internet Information Services: **iisreset**

7.6.1.3 Deploy Entitlement Manager for SharePoint Server to your SharePoint Farm

On the SharePoint Server, complete standard Entitlement Manager for SharePoint Server deployment per NextLabs documentation available to customers using the following steps:

1. On the SharePoint Server, click the **Start** icon to see the applications pinned to the **Start** menu.

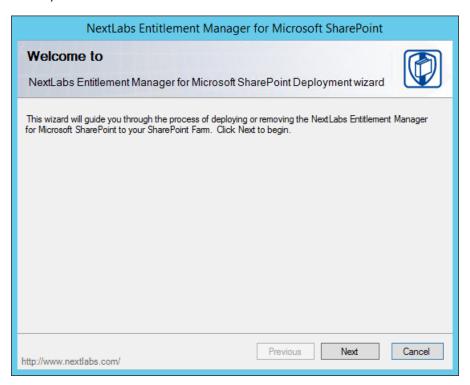

3762 3763 2. Click on the NextLabs Entitlement Manager for SharePoint Server Deployment icon.

This shortcut is automatically pinned during the initial installation. In case the shortcut is not created automatically, the application can be opened from File Explorer at the location:

C:\Program Files\NextLabs\SharePoint Enforcer\bin\NextLabs.Entitlement.Wizard.exe

3. At the Welcome to NextLabs Entitlement Manager for Microsoft SharePoint Deployment wizard screen, click **Next**.

37643765

4. At the System Check screen, after the system check is complete, click **Next**.

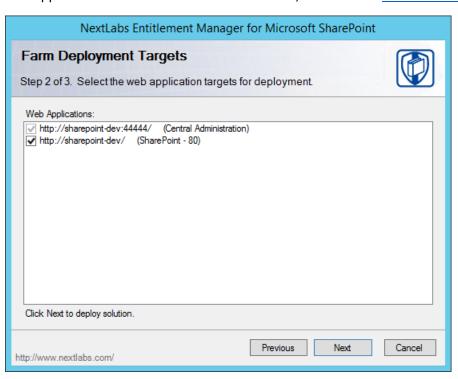

3768

37693770

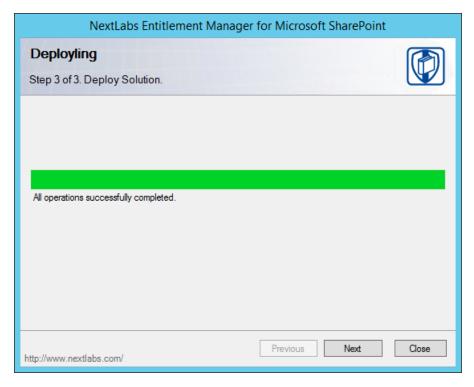

5. At the Farm Deployment Targets screen, select the applicable web application on which to deploy.

<u>Note</u>: if there is only one entry listed, i.e., *http://sharepoint:44444/Central Administration*, no web applications have been created. In that case, refer back to Section 7.6.1.1.

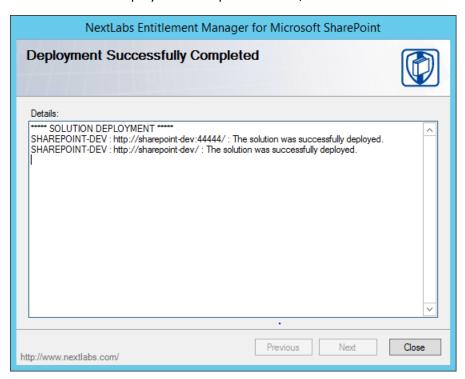

37713772

6. At the Deploying Step 3 of 3 screen, click Next.

3774

7. At the Successful Deployment Completed screen, click **Close**.

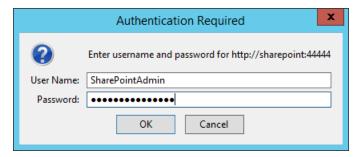

3775

3776

- 7.6.1.4 Enable Policy Enforcement on your Web Application via SharePoint Central Administration
- 1. On the SharePoint Server, open an Internet browser and navigate to the following URL: http://sharepoint:44444 to login to the SharePoint Central Administration portal.

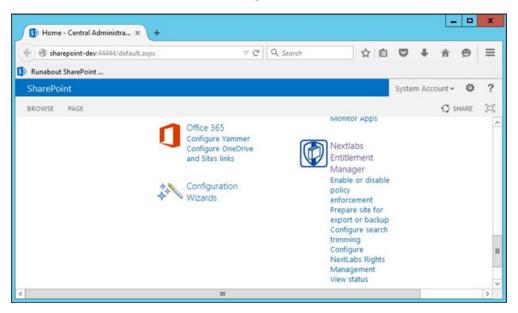

2. Enter the **User Name** and **Password** for your SharePoint Central Administration account, and click **OK**.

3782

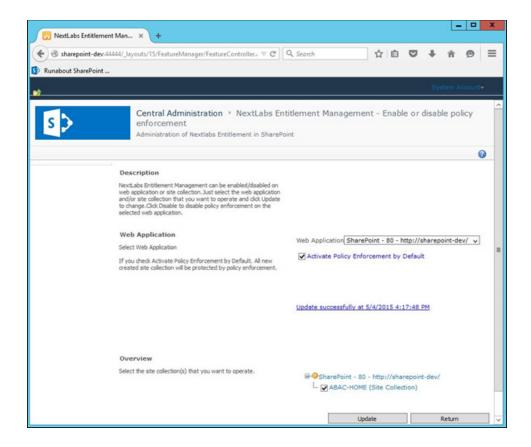

3783

3. Click on the NextLabs Entitlement Manager icon.

3784

4. In the page that opens, scroll down to verify that the correct **Web Application** is chosen and the service is **Enabled.**

3788

3789

3790 3791

3792

3793

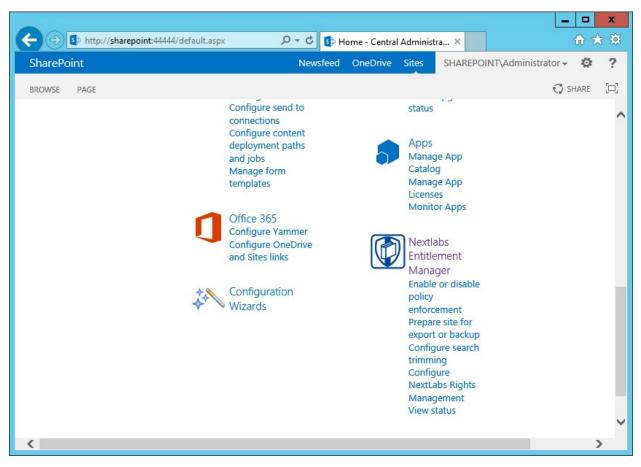

3794

3795

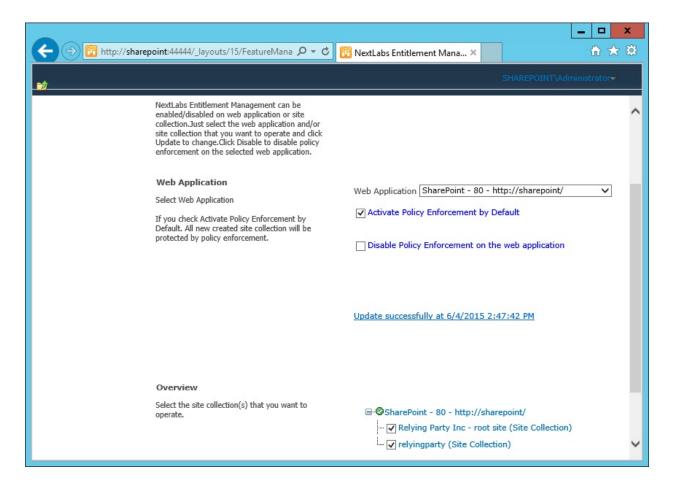

3796 3797

7.7 Functional Tests

- 7.7.1 Verify that the NextLabs Webpart for Policy Enforcement Has Been Successfully Enabled on the Site Collection in SharePoint
 - 1. Similar to <u>Section 7.6.1.4</u>, complete the following steps to login to SharePoint Central Administration:
 - a. Click on the Start icon.
 - b. Click the NextLabs Entitlement Manager for SharePoint icon.
 - c. Open SharePoint Central Administration and login as Administrator.
 - Click on Enable or disable policy enforcement under the NextLabs Entitlement Manager webpart.

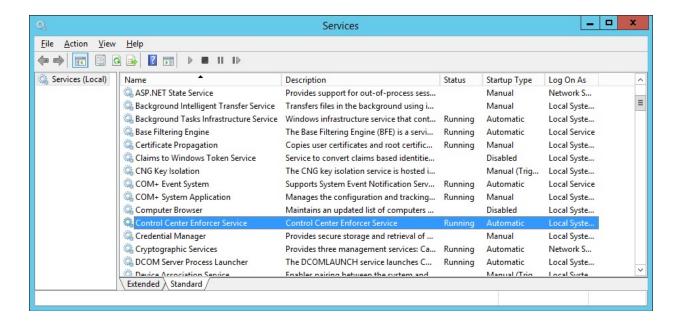

3. Scroll down to the **Web Application** area to verify that the Entitlement Manager is activated for the correct SharePoint web application.

3802

7.7.2 Test to Verify the NextLabs Service is Running

- 3803 1. Click on the Windows Start icon.
- 3804 2. Start typing the word **Services**.
- 3. Click on the Windows Services icon to open the list of running services.
- 4. Look for the NextLabs Policy Controller service called **Control Center Enforcer Service**.
- 3807 5. Verify that the status is **Running**.

8 Defining Policies and Enforcing Access Decisions with NextLabs

8.1 Introduction

In previous sections of this How-To Guide, we installed several NextLabs products that can be used to define and deploy Attribute Based Access Control (ABAC) policies, and enforce decisions regarding user access to Microsoft SharePoint resources based on user, object, and environmental attributes, and the corresponding policies in place. This How-To Guide will illustrate how to use and configure NextLabs Policy Studio, the product responsible for Policy Lifecycle Management, and discuss policy strategy and the translation of business logic into policy.

Within Policy Studio, we will define and deploy policies and policy components. In NextLabs, the word **Component** is a named definition that represents a category or class of entities, such as users, data resources, or applications; or of actions, such as Open or Copy. Components are similar to using parts of speech to construct policy statements. For example:

- Noun: All employees in the human resources department or Any file with an .xls extension
- Verb: Copy, Print, or Rename File

Deployment is simply the distribution of new or modified policies and policy components to the appropriate enforcement points on desktop PCs, laptops, and file servers throughout the organization. This means you can create, review and refine policies as long as you like, but they are not enforced until you actually deploy them.

Finally, the Functional Test section will illustrate how to ensure that policies are being updated, evaluated, and enforced on Microsoft SharePoint.

3830	8.1.1	Cor	nponents and Sub-Components Used in this How-To Guide			
3831 3832 3833 3834	1.	compoi implem	bs Policy Studio –provides the Policy Administration Point of the ABAC architecture. This nent was installed with the rest of the NextLabs product suite used in this sentation in Section 7 . 3855 3856		f.	Install and configure NextLabs Control Center, Policy Studio, and Policy Controller (see Section 7).			
3857	8.2	Policy	y Strategy			
3858	8.2.1	Тор	-Level Blacklisting Deny Policy, Whitelisting Allow Sub-Policies			
3859		In order to demonstrate a policy set with high security and fine-grained control, we employed a general				
3860	blacklisting, then fine grained whitelisting sub-policy strategy for the policies. We chose this strategy					
3861	because we considered it a more secure paradigm for securing SharePoint resources. Using this strategy					
3862	the access control logic initially applies a general deny all access decision at the top level for a given set					
3863 3864	of related attributes, then specifies conditions under which access can be allowed in various sub-policies based on sufficient correlating user, resource, and/or environment attributes. For example, later in this					

SECOND DRAFT

guide we will describe a policy set in which we initially deny all users on resources that have a sensitivity level attribute, however there is a sub-policy that specifies that a for resources at sensitivity level 2, allow users with a clearance attribute of **Secret** during regular business hours. The alternative to this approach would be to apply a general allow all access decision at the top level initially, then specify conditions under which users should be denied access. Because there can be many unforeseen edge cases that may not be anticipated by a business protecting its assets, we consider the general blacklisting, then whitelisting sub-policies approach a more feasibly secure solution. According to our strategy, any time a user, resource, or environment attribute does not comply with a whitelisting sub-policy to allow access, the access decision will default to deny.

8.2.2 Global Policies

In addition to the blacklisting versus whitelisting approach taken in our policy strategy, we also employed the use of global policies. The term **global policy** refers to the general applicability of the policy sets to more than one user and more than one resource at a given time. We defined our policies such that they have global effects and do not apply only to very specific use cases by themselves. The collective logic taken from the multiple global policies in place applies to the many kinds of access events that must be controlled according to a business's complex and distributed business rules, which we describe below in Section 8.3.

8.3 Translation of Business Logic into Policy

8.3.1 ABAC Build Scenario – Runabout Air Business Rules

In previous sections of our Practice Guide we have constructed an example business scenario where an airline company, Runabout Air, has acquired another airline company, Conway Airlines. In this scenario the two companies have not yet merged their active directory forest and established a trust relationship such that historically Conway Airlines employees will be able to access resources on the Runabout Air SharePoint according to policies that correspond to Runabout Air's business rules. The business rules we based our policies on are, generally:

- 1. Some documents are more sensitive than others, and should be marked in SharePoint at different sensitivity levels. These documents should be strictly protected, and access should be restricted to Runabout Air's normal business hours. Also, users should only be granted access to sensitive documents if they have sufficient clearance.
- 2. Users should only be able to access documents that belong to their department, or to the departments relevant to them in the case of some instances of a need for cross-department access, i.e., business intelligence employees should have access to both sales and marketing department documents.
- 3. Some documents are time-sensitive and pertain to system or other business maintenance, and should be marked in SharePoint as maintenance documents. These documents should only be accessed outside of Runabout Air's normal business hours, so as to reduce the likelihood of disruption of normal business operation.
- 4. There are times when a suspicious IP address or range of addresses should be blocked from accessing any SharePoint resources, or when a user from a particular IP address or range of IP addresses should only have access to low-sensitivity documents. There must be a mechanism in

place to ensure access is denied for users attempting to access any high-sensitivity documents from an environment with that IP address or within a given IP address range.

8.3.2 Translation of Runabout Air Business Rules into ABAC Policies

ABAC Policies created from the above business rules might look like this:

- 1. Top-level sensitivity policy: default to deny access to all users attempting to access resources that have a sensitivity level attribute defined in SharePoint as greater than **0**, unless explicitly allowed access by a sub-policy.
 - a. For documents whose sensitivity attribute is defined as **1**, allow access any time of day, any day of the week, to users with a clearance attribute of **None**, **Secret**, or **Top Secret**.
 - b. For documents whose sensitivity attribute is defined as **2**, allow access between the hours of 6am and 6pm for users with a clearance attribute of **Secret** or **Top Secret**.
 - c. For documents whose sensitivity attribute is defined as **3**, allow access between the hours of 6am and 6pm for users with a clearance attribute of **Top Secret**.
- 2. Top-level department policy: default to deny access to all users attempting to access resources that have a department attribute and project status defined in SharePoint.
 - a. For users whose department attribute is defined as a value equal to the document's department attribute value, allow access for documents with a project status of any value.
 - b. For users whose department attribute is **Business Intelligence**, allow access for documents with a department attribute of **Sales** or **Marketing** and with a Project status of any value.

Note: The Project status metric is necessary because the department attribute is defined at the site level within SharePoint. Restricting users based only on the resource's department attribute in this policy set results in the user being stuck in a deny access loop, no longer being able to access the Runabout Air root site and navigate to their correct department's documents. Because each document has a project status attribute defined in addition to the department attribute, the policies can specify the targets of this policy as having both project status and department attributes defined, even though the department attribute is the most pertinent attribute for enforcing the access control relating to department access rules.

- 3. Top-level maintenance policy: default to deny access to all users attempting to access resources that have a maintenance attribute defined in SharePoint
 - a. For documents whose maintenance attribute is defined as **no**, allow access to users, any time of day, any day of the week.
 - b. For documents whose maintenance attribute is defined as **yes**, allow access to users between 6pm and 6am, any day of the week.
- 4. Top-level IP Address policy: default to deny access to all users attempting to access resources that have a sensitivity attribute defined in SharePoint.
 - a. For documents whose sensitivity attribute is defined as **1**, allow access to any user from an environment with any IP address defined.

8.4 Using the NextLabs Policy Studio GUI for Policy Definition and Deployment

In this section, we will provide step-by-step instructions for how to define, deploy, modify and redeploy, and deactivate necessary policy components and policies within Policy Studio. The examples we will use correspond to the Runabout Air business rules and ABAC policies described in Section 8.3.1 and Section 8.3.2. Note that Policy Studio was installed on the SQL Server, which is where all of the activity in Section 8.4 occurs.

8.4.1 Login and Initial Screen in Policy Studio

Given you have followed the instructions found in <u>Section 7</u>, follow these instructions to login to the NextLabs Policy Studio:

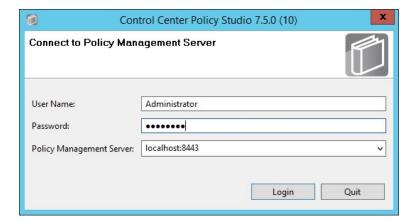

- 1. In Windows Explorer, find and open the **policystudio.exe** application file:
 - a. Double-click the C:/ drive.
 - b. Double-click Program Files.
 - c. Double-click NextLabs.
 - d. Double-click Policy Studio.
 - e. Double-click policystudio.exe.

3962 3963

3964

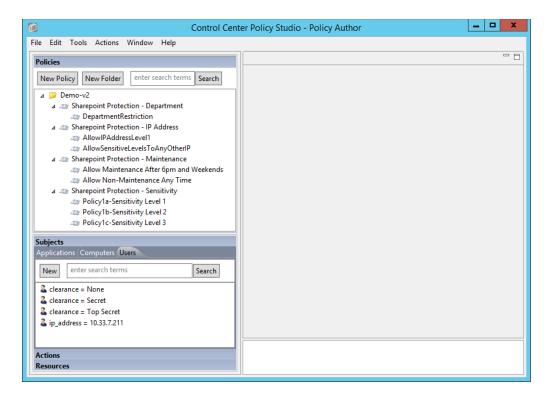

2. In the Control Center Policy Studio window, enter **User Name** and **Password**, then click **Login** to connect to the Policy Management Server.

3. If login was successful, you will see the Policy Studio's graphical user interface, specifically the main screen where new policies and new components are defined, deployed, modified, and deactivated. Note the **Policies** panel in the top-left, the **Components** panel in the bottom-left, and an open space to the right where editing panels emerge for editing the policies and components.

4. After following the instructions in this section to define and deploy several user and resource components, as well as four policy sets, the Policy Studio interface will show the new components and policies populated in the left-side panel.

3976

8.4.2 Policy Studio Menu Commands

3977 Below are some of the Policy Studio menu commands used in this How-To Guide, along with 3978 explanations for what action they perform.

3979 Extracted from the NextLabs Policy Studio User guide available to customers:

Menu	Command	Function	
File	Exit	Closes Policy Studio.	
Edit	Delete	Deletes the currently selected item or items.	
	Duplicate	Creates a clone of the selected component	

Menu	Command	Function		
Actions	Modify	Changes the status of the currently displayed component or policy to Draft. You must do this whenever you want to make any changes to a component or policy that has been submitted. Function is the same as the Modify button at the bottom of the Editing pane.		
	Submit	Submits the currently selected components or policies for changing from one status to another—for example, from Draft status to Submitted for Deployment. Function is the same as the Submit button at the bottom of the Editing pane. Disabled if no object is selected, or if any of the selected objects is not currently in Modify state.		
	Deploy	Deploys the currently displayed component or policy. Function is the same as the Deploy button at the bottom of the Editing pane. As with individually deployed objects, you can specify a scheduled deployment, or choose Now. Disabled if no object is selected, or if the selected object has not been submitted for deployment.		
	Deploy All	Deploys all currently submitted components or policies. Function is the same as the Deploy button at the bottom of the Editing pane.		
	Deactivate	Changes the status of the currently selected policies or components from Active to Deactivated. Disabled if no object is selected, or if any of the selected objects is not currently in Active state.		
Window	Preview	Opens the Preview pane, at the right side of the Editor pane. The Preview pane allows you to test the actual content that would result from the current definition of a component.		
	Policy Manager	Toggles to the Policy Manager interface. You can also type Ctrl + Tab.		
	Policy Author	Disabled		

8.4.3 Defining and Deploying Components

8.4.3.1 Explanation of Components in NextLabs

According to the NextLabs Policy Studio User Guide available to customers, it is necessary to define components to represent various kinds of entities in your information environment. There are several times when you might want to define a new component:

- 1. After setting up your Control Center system, before constructing policies for the first time (which is the reason here at this point in our How-To literature)
- 2. When new classes of information or users come under the control of information policy
- 3. When a new policy requires a policy component that has not yet been created
- 4. When conditions at the organization change in any way that adds new items to be covered by information control policies. For example, if the company reorganizes and adds a new division, you might need a new policy component to represent the employees in that division.

Furthermore, when you are constructing a component, you do not need to save your work explicitly. Work is automatically saved as you go. If you are interrupted while working on a policy component, or want to work on another task and return to constructing the policy component later, you can stop and continue the constructing process as desired. Your work will be saved in draft status. You can find the policy component later in the appropriate component panel.

8.4.3.2 Defining and Deploying User Components

According to the Runabout Air business rules in <u>Section 8.3.1</u> and ABAC policies in <u>Section 8.3.2</u>, it is possible that you may need to create a User Component to match the following conditions: user clearance attribute, user department attribute, and user IP address. This is correct, except for the user department attribute. Because of the cross-departmental access of Runabout Air's Business Intelligence employees, we use logical syntax instead of graphical components while defining that policy. Also, a

SECOND DRAFT

note regarding the user IP address component: even though IP address is an environmental attribute, it can be configured in NextLabs as a user attribute coming from SharePoint Claims, or as a resource attribute, which requires different configuration in NextLabs. For our example, we use the IP Address from SharePoint Claims, which is handled as a user attribute.

4009 8.4.3.2.1 Clearance Components

8.4.3.2.1.1 CLEARANCE = NONE

1. In the Components panel in the bottom-left of the Policy Studio window, click on the **Subjects** heading, and then click on the **Users** tab. Then click **New** to create a new component.

4013 4014

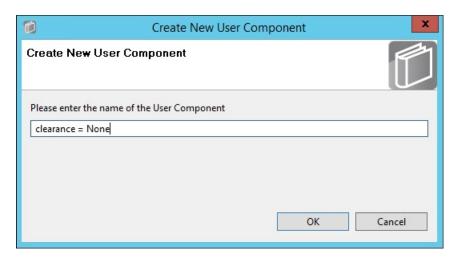

4015

4010

4011

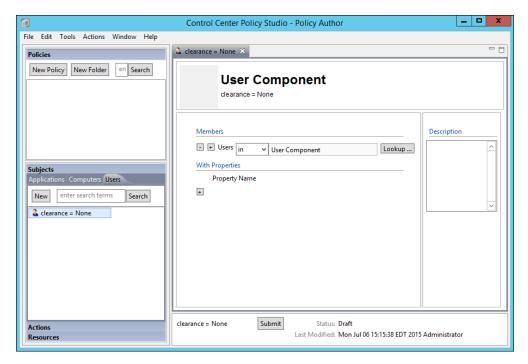

4012

2. In the Create New User Component window, enter a descriptive component name, such as clearance = None. Click OK.

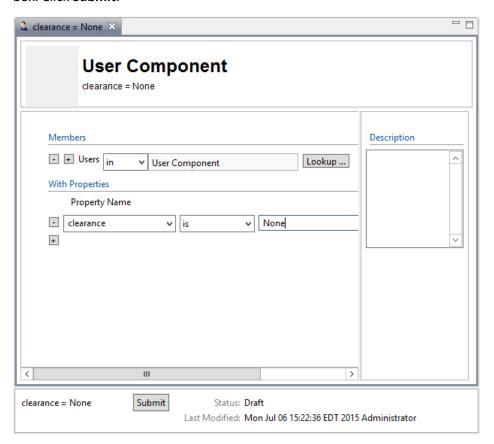

4016

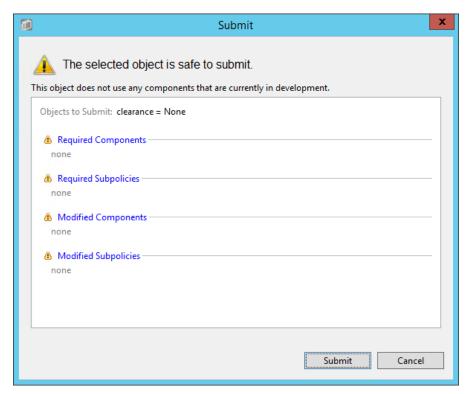

4017 3. In the component editing panel you will see the following:

4. In the editing panel, click on the **plus sign** box under Property Name and enter **clearance** in the property name text box, keep the default **is** as the action, then enter **None** into the value text box. Click **Submit**.

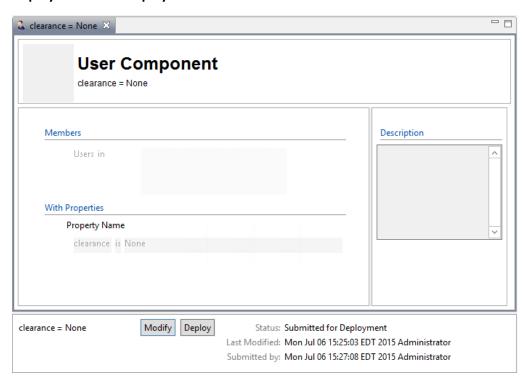

4023 5. In the Submit window, click **Submit**.

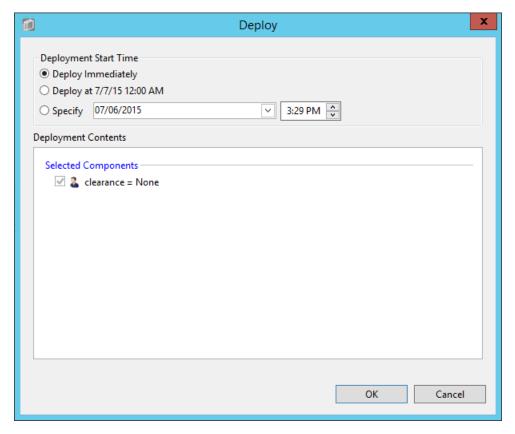

4024 4025

4026

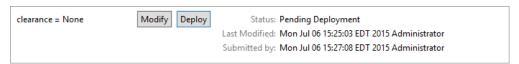

From the component editing panel, note the differences. The new status reads Submitted for Deployment. Click Deploy.

7. In the Deploy window, click **OK**. Note: You may deploy immediately, which we choose in our example. You could also deploy the following day at midnight, or at a different specific date and time.

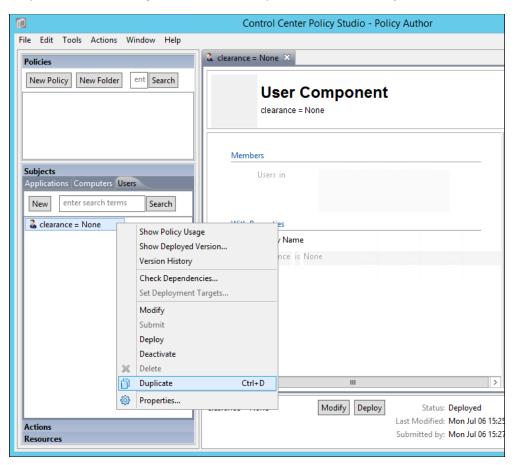

4032 8. Verify at the bottom of the component editing panel that the Status now reads **Pending**4033 **Deployment**. This will remain for the duration of the heartbeat (described in <u>Section 7</u>).

9. After the duration of the heartbeat has passed, Status will then read as **Deployed**. This indicates that the component is actively deployed in your ABAC system.

clearance = None	Modify Deploy	Status: Deployed
		Last Modified: Mon Jul 06 15:25:03 EDT 2015 Administrator
		Submitted by: Mon Jul 06 15:27:08 EDT 2015 Administrator

- 4038 8.4.3.2.1.2 CLEARANCE = SECRET
- The easiest way to create additional attribute components is to duplicate existing ones. To duplicate the existing user attribute component:
- 1. From the Component panel, highlight the name of the existing component, i.e., **clearance** = **None**
 - 2. Click on **Edit** from the menu toolbar at the top of the window and select **Duplicate** from the drop-down menu, or right-click on the component and select **Duplicate** from the floating menu:

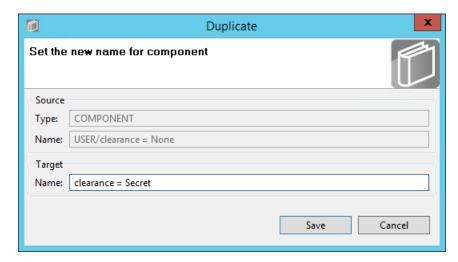

4046

4047

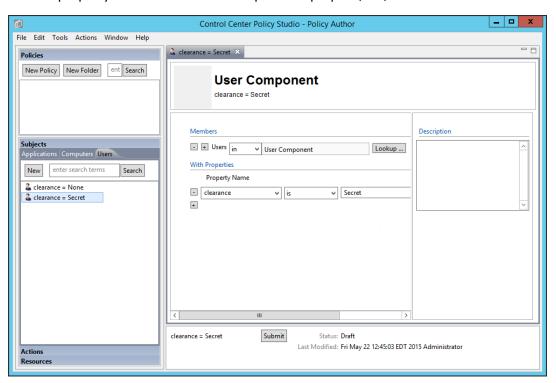

4043

4044

3. In the Duplicate window, edit the name of the new component, i.e., clearance = **Secret**. Click **Save**.

40.49 4. Edit the property value to match the component's purpose, i.e., **Secret**. Click **Submit**.

4050

4051

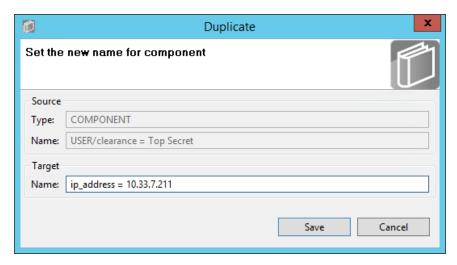

4053

4054

4055

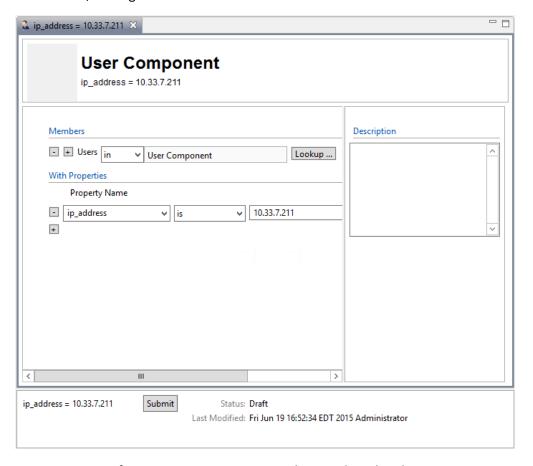

4057

- 5. Repeat steps 5-9 from Section 8.4.3.2.1.1 to Submit and Deploy this component.
- 4052 8.4.3.2.1.3 CLEARANCE = TOP SECRET
 - Repeat steps 1-5 in <u>Section 8.4.3.2.1.2</u> for duplicating a new user attribute component. The new component should be named **clearance = Top Secret**, and the property value should equal **Top Secret**.
- 4056 8.4.3.2.2 IP Address component
 - 1. Repeat steps 1-3 in <u>Section 8.4.3.2.1.2</u> for duplicating a new user attribute component. The new component should be named **ip_address = 10.33.7.211.**

4061

2. From the component editing panel, edit the **Property Name** to **ip_address** and the value to **10.33.7.211**, leaving the default action **is**. Then click **Submit**.

4062

4063

3. Repeat steps 5-9 from <u>Section 8.4.3.2.1.1</u> to Submit and Deploy this component.

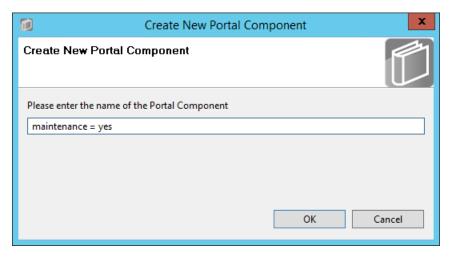

- 4064 8.4.3.3 Defining and Deploying Resource Components
- 4065 8.4.3.3.1 Maintenance components
- 4066 8.4.3.3.1.1 MAINTENANCE = YES
 - 1. In the Components panel in the bottom-left of the Policy Studio window, click on the **Resources** heading, and then click on the **Portals** tab. Then, click **New** to create a new component.

4067

4068

2. Enter a descriptive component name, such as maintenance = yes, then click OK.

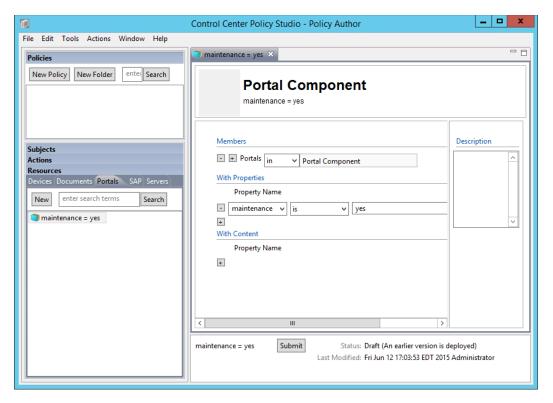

4071 4072

4073

4074

3. In the editing panel, click on the **plus sign** box under Property Name and enter **maintenance** in the **Property Name** text box, keep the default **is** as the action, and enter **yes** into the value text box. Then click **Submit**.

4078 4079

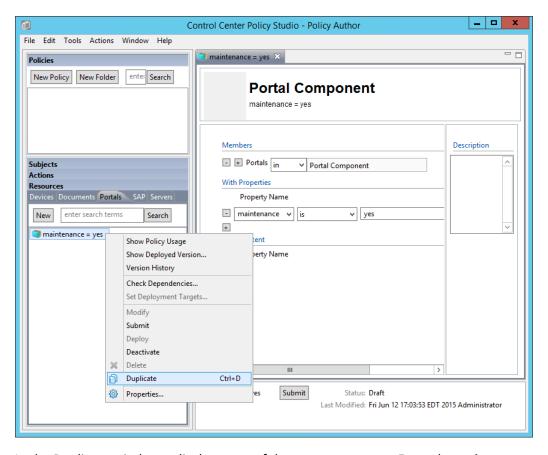

4080

4081

- 4. Repeat steps 5-9 from <u>Section 8.4.3.2.1.1</u> to Submit and Deploy this component.
- 4077 8.4.3.3.1.2 MAINTENANCE = NO

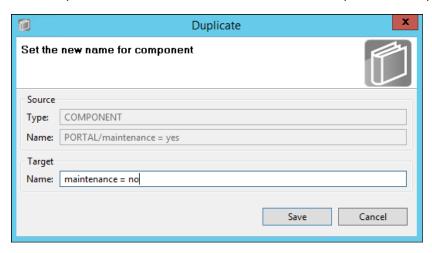

Similar to the steps taken for duplicating user components, do the following to duplicate the existing resource maintenance component to create the other resource components.

1. In the Component panel in the bottom-left corner of the Policy Studio interface, right-click on the **maintenance = yes** component. In the floating menu, select **Duplicate**.

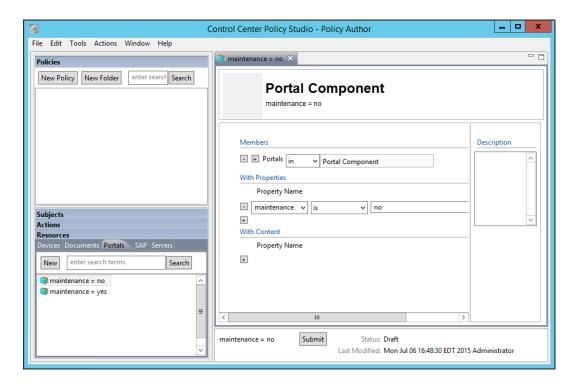

4083

2. In the Duplicate window, edit the name of the new component. Example: maintenance = no.

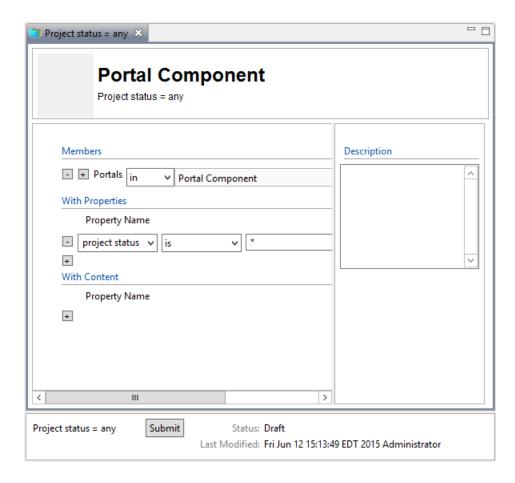

4084 4085

3. In the component editing panel, change the property value to **no** and click **Submit**.

- 4087 4. Repeat steps 5-9 from <u>Section 8.4.3.2.1.1</u> to Submit and Deploy this component.
- 4088 8.4.3.3.2 Sensitivity components
- 4089 8.4.3.3.2.1 SENSITIVITY = 1
- 4090 Repeat steps 1-4 from <u>Section 8.4.3.3.1.2</u> to duplicate an existing resource component to create the
- 4091 Sensitivity = 1 component.
- 4092 8.4.3.3.2.2 SENSITIVITY = 2
- 4093 Repeat steps 1-4 from <u>Section 8.4.3.3.1.2</u> to duplicate an existing resource component to create the
- 4094 Sensitivity = 2 component.
- 4095 8.4.3.3.2.3 SENSITIVITY = 3
- 4096 Repeat steps 1-4 from Section 8.4.3.3.1.2 to duplicate an existing resource component to create the
- 4097 Sensitivity = 3 component.
- 4098 8.4.3.3.3 Project status component
- 4099 8.4.3.3.3.1 PROJECT STATUS = ANY
- 4100 Repeat steps 1-4 from Section 8.4.3.3.1.2 to duplicate an existing resource component to create the
- 4101 Project status = any component.
- 4102 Note: Before the Submit step, in the component editing panel, enter the property value as *.

4105

4106

4107

4109

4110

4111

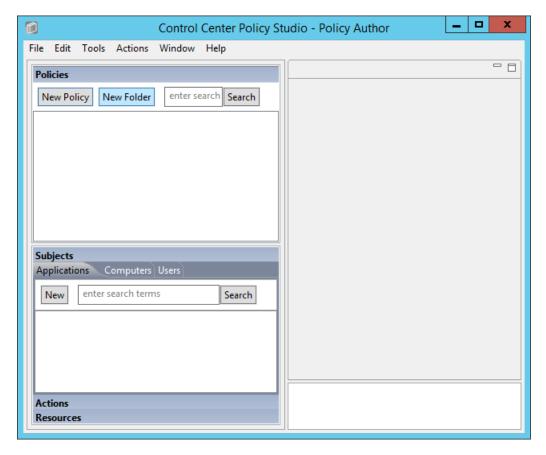

4104 8.4.4 Defining Policy

After following the steps to define and deploy components in <u>Section 8.4.3</u>, you can continue on to define policies that relate to the Runabout Air scenario business rules discussed in <u>Section 8.3</u>. In order to define policies in Policy Studio, login as described in <u>Section 8.4.1</u>.

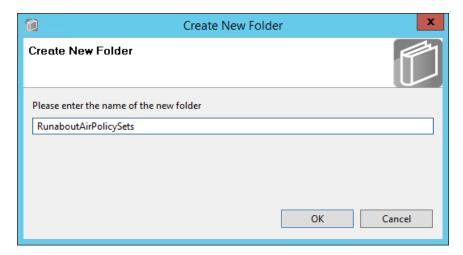

4108 8.4.4.1 Creating a Policy Set Folder

Before being able to create any policies in Policy Studio, first you must create a folder, or choose an existing one.

1. From the main Policy Studio window, click New Folder.

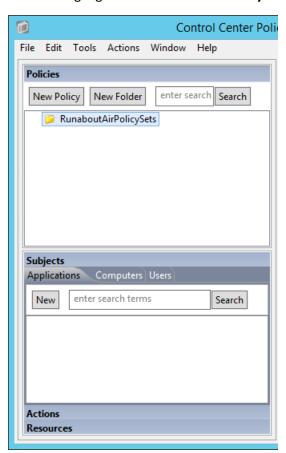

4113 2. Enter the **name** of your folder and click **OK.**

4115 8.4.4.2 Defining Department-based Policy Set

4116 8.4.4.2.1 Defining the Top-level Department Policy that Enforces a General Deny Decision

1. In the Policies panel in the top-left corner of the main Policy Studio window, click on your new folder to highlight it. Then click **New Policy**.

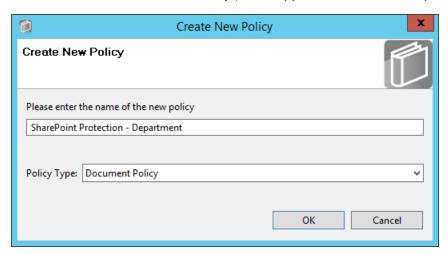

4119 4120

4121

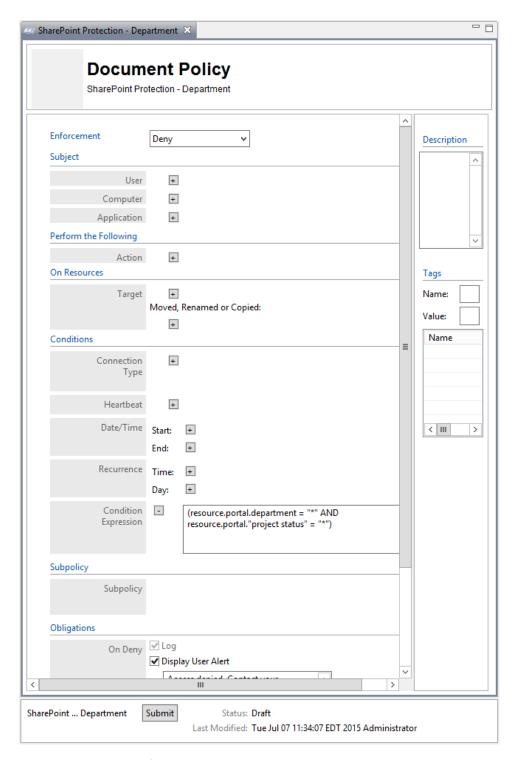

4117

4118

2. In the Create New Policy window, enter a **name** for the new policy. From the **Policy Type** drop-down menu, select **Document Policy** (which applies to all SharePoint policies). Click **OK**.

4123 4124	3.	The new policy opens automatically in an editing panel. For this policy, keep the default Deny enforcement. Make these edits:
4125		a. In the On Resources area, click on the plus sign box next to Target . This automatically
4126		populates in and Resource Component.
4127		b. In the Condition Expression enter the ACPL: (resource.portal.department = "*" AND
4128		resource.portal.project status = "*")
4129		c. In the Obligations area, check the Display User Alert box in order to customize the deny
4130		message displayed to the user when access is denied.
4131	4.	In the policy editing panel, your policy should look like this:

4133

	SECOND DRAFT
4134 4135 4136 4137	 8.4.4.2.2 Defining a Department-based Sub-policy that Enforces an Allow Decision when Certain Conditions are met 1. In the Policies panel in the top-left corner of the main Policy Studio window, click on your new policy to highlight it. Then click on New Policy to create a sub-policy.
4138	2. Select a name for the new sub-policy then click OK .
4139	3. In the policy editing panel, make the following edits:
4140	a. From the Enforcement drop-down menu, select Allow.
	Document Policy DepartmentRestriction

4142

4143

4144

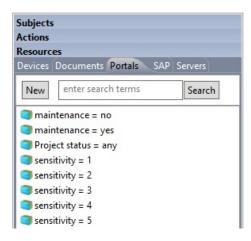

i. In the Components panel, click on **Resources**, then the **Portals** tab to see the components you created earlier.

ii. From the Portals tab, left-click and hold the **Project status = any** component and

Moved, Renamed or Copied:

✓ Project status = any Resource Component

٧

Allow

b. In the On Resources area, click on the plus sign box next to Target.

4291

4292

4293

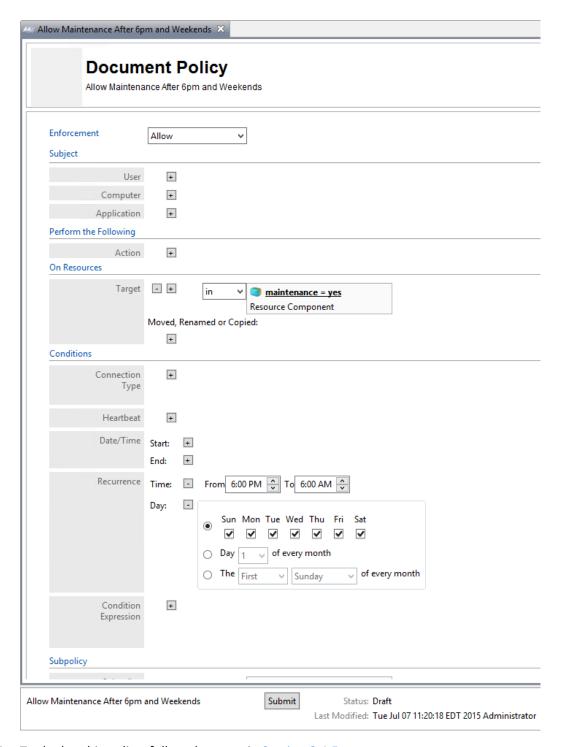

1277	8.4.4.4.2	Defining a Maintenance-based Sub-policy that Enforces an Allow Decision when Certain
4278		Conditions are met for Access to Documents whose Maintenance Attribute is defined as Yes
1279	Similar to	the instructions in Section 8.4.4.2.2 for defining a Department-based sub-policy, do the
4280	following:	

- 1. In the Policies panel in the top-left corner of the main Policy Studio window, click on your new policy to highlight it. Click **New Policy** to create a sub-policy under this main policy.
- 2. Select a **name** for the new sub-policy, then click **OK**.
- 3. In the policy editing panel, make the following edits:
 - a. From the Enforcement drop-down menu, select Allow.
 - b. In the On Resources area, click on the plus sign box next to Target.
 - In the Components panel in the bottom-left corner of the Policy Studio window, click on **Resources**, then the **Portals** tab to see the components you created earlier.
 - ii. Left-click and hold the **maintenance** = **yes** component to drag it onto the **Target** field.
 - c. In the Conditions area, click on the **plus sign** boxes next to **Time** and **Day**. Edit those fields to match below:

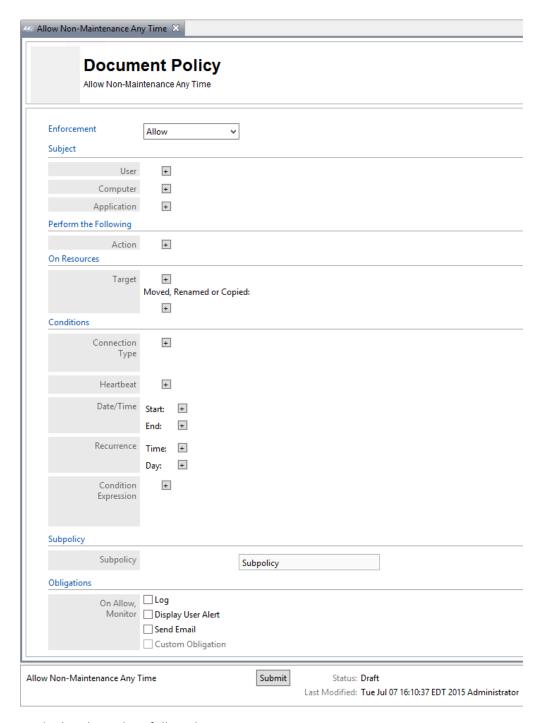

4294

4. In the policy editing panel, your policy should look like this:

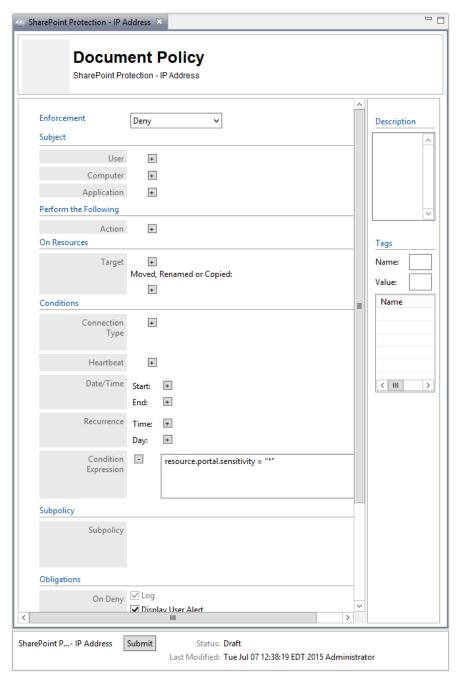

4298 4299	8.4.4.4.3 Defining a Maintenance-based Sub-policy that Enforces an Allow Decision when Certain Conditions are met for Access to Documents whose Maintenance Attribute is defined as No
4300 4301	Similar to the instructions in <u>Section 8.4.4.2.2</u> for defining a Department-based sub-policy, do the following:
4302 4303	 In the Policies panel in the top-left corner of the main Policy Studio window, click on your new policy to highlight it. Click New Policy to create a sub-policy.
4304	2. Select a name for the new sub-policy, then click OK .
4305	3. In the policy editing panel, make the following edits:
4306	a. From the Enforcement drop-down menu, select Allow.
4307	b. In the On Resources area, click on the plus sign box next to Target .
4308	i. In the Components panel in the bottom-left corner of the Policy Studio window,
4309	click on Resources , then the Portals tab to see the components you created
4310	earlier.
4311	ii. Left-click and hold the maintenance = no component to drag it onto the Target
4312	field.
4313	4. In the policy editing panel, your policy should look like this:

4315

4316	8.4.4.5	Defining an IP Address-based Policy Set
4317 4318		r to define an IP address-based policy set, follow instructions similar to defining the department- policy set in <u>Section 8.4.4.2</u> .
4319 4320 4321	8.4.4.5. 1.	Defining the top-level IP Address Policy that Enforces a General Deny Decision In the Policies panel in the top-left corner of the main Policy Studio window, click on your new folder to highlight it. Then click New Policy .
4322 4323	2.	In the Create New Policy window, enter a name for the new policy. From the Policy Type dropdown menu, select Document Policy (which applies to all SharePoint policies). Click OK .
4324 4325	3.	The new policy opens automatically in an editing panel. For this policy, keep the default Deny enforcement. Make these edits:
4326	4.	In the Condition Expression, enter the ACPL: resource.portal.sensitivity = "*"
4327 4328	5.	In the Obligations area, check the Display User Alert box in order to customize the deny message displayed to the user when access is denied.
4329	6.	In the policy editing panel, your policy should look like this:

7. To deploy this policy, follow the steps in <u>Section 8.4.5</u>.

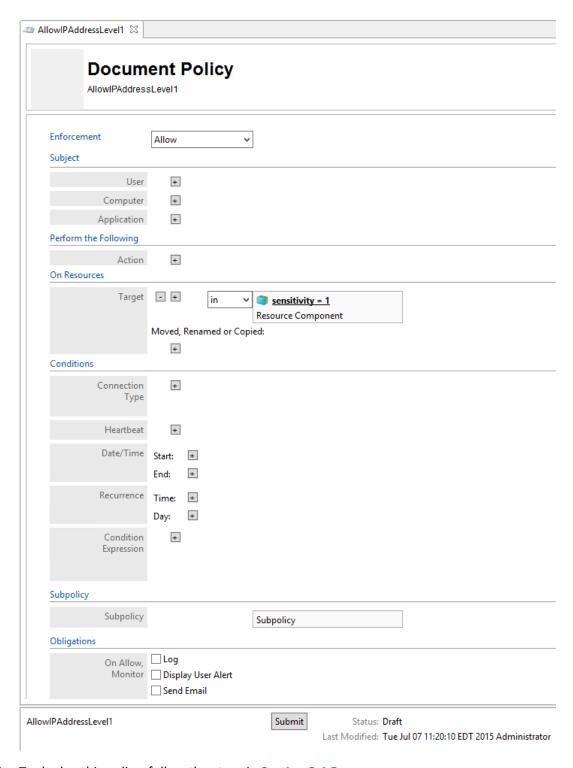

4332 4333 8.4.4.5.2

Defining an IP Address-based Sub-policy that Enforces an Allow Decision for Access to Resources at any Sensitivity Level when a User does not come from an Environment with a Restricted IP Address (ex: 10.33.7.211)

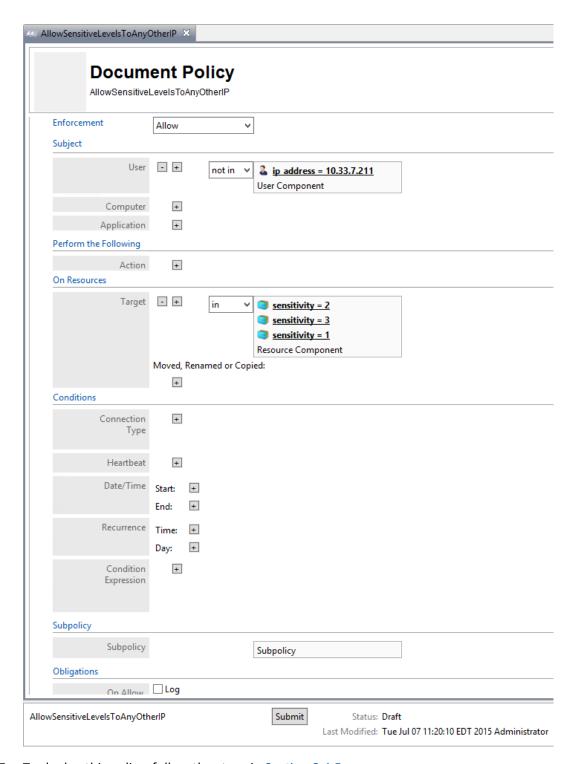

4334 Restricted IP Address (ex: 10.33.7.211)
4335 Similar to the instructions in Section 8.4.4.2.2 for defining a Department-based sub-policy, do the
4336 following:

4337 4338 1. In the Policies panel in the top-left corner of the main Policy Studio window, click on your new policy to highlight it. Click **New Policy** to create a sub-policy.

4339	2. Select a name for the new sub-policy, then click OK .
4340	3. In the policy editing panel, make the following edits:
4341	a. From the Enforcement drop-down menu, select Allow.
4342	b. In the On Resources area, click on the plus sign box next to Target .
4343	i. In the Components panel in the bottom-left corner of the Policy Studio window,
4344	click on Resources, then the Portals tab to see the components you created
4345	earlier.
4346	ii. Left-click and hold the sensitivity = 1 component to drag it onto the Target field
4347	4. In the policy editing panel, your policy should look like this:

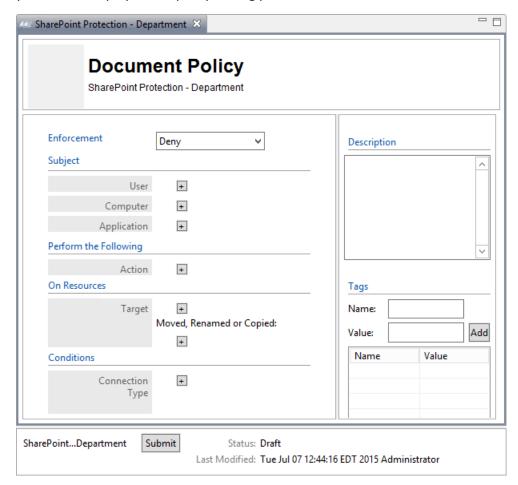

4350 4351 4352	8.4.4.5.3 Defining an IP Address-based Sub-policy that Enforces an Allow Decision for Access to Resources at Only Sensitivity Level 1 when a User comes from an Environment with a Restricted IP Address (ex: 10.33.7.211)
4353 4354	Similar to the instructions in <u>Section 8.4.4.2.2</u> for defining a Department-based sub-policy, do the following:
4355 4356	 In the Policies panel in the top-left corner of the main Policy Studio window, click on your new policy to highlight it. Then click New Policy to create a sub-policy.
4357	2. Select a name for the new sub-policy, then click OK .
4358	3. In the policy editing panel, make the following edits:
4359	a. From the Enforcement drop-down menu, select Allow.
4360	b. In the Subject area, click on the plus sign box next to User.
4361	i. From the drop-down menu, select not in .
4362	ii. In the Components panel in the bottom-left corner of the Policy Studio window,
4363	click on Subjects, then the Users tab to see the components you created earlier.
4364 4365	 Left-click and hold the ip_address=10.33.7.211 component to drag it onto the User field.
.005	Subject
	User - + not in \checkmark ip address = 10.33.7.211 User Component
	Computer +
4366	Application +
4367	c. In the On Resources area, click on the plus sign box next to Target .
4368	i. In the Components panel in the bottom-left corner of the Policy Studio window,
4369	click on Resources , then the Portals tab to see the components you created
4370	earlier.
4371	ii. Left-click and hold the sensitivity = 1 component to drag it onto the Target field
4372	iii. Left-click and hold the sensitivity = 2 component to drag it onto the Target field
4373	iv. Left-click and hold the sensitivity = 3 component to drag it onto the Target field.
4374	4. In the policy editing panel, your policy should look like this:

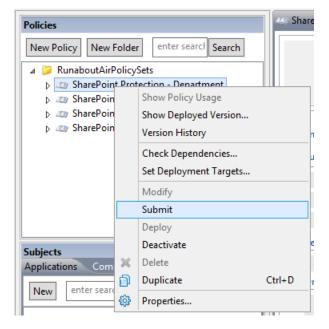

- 4377 8.4.5 Deploying Policy
- 4378 In order to deploy policies, follow steps similar to those for deploying a component (see
- 4379 Section 8.4.3.2.1.1):

1. In the Policies panel in the top-left corner of the main Policy Studio window, click on the policy you want to deploy. In the policy editing panel, click **Submit**.

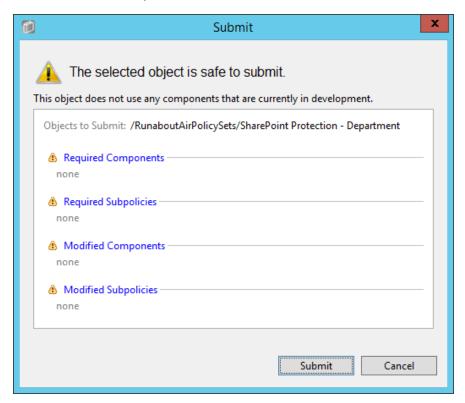

4382

4383 4384 a. Or, in the Policies panel in the top-left corner of the main Policy Studio window, right-click the policy you want to deploy. Select **Submit** from the floating menu.

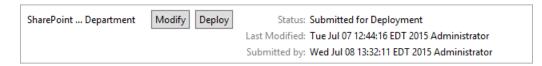

2. In the Submit window, click **Submit**.

- 3. From the component editing panel, note the differences. The new status reads **Submitted for Deployment**. Click **Deploy**.

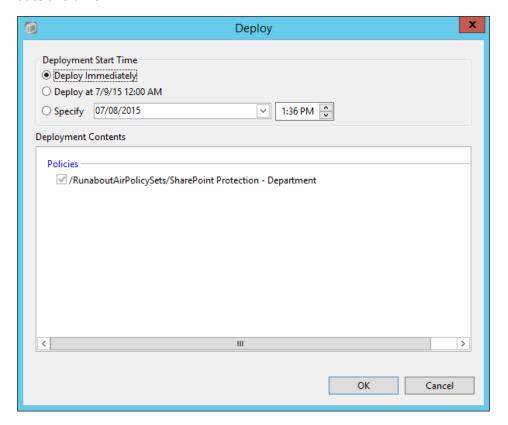

a. Or, in the Policies panel in the top-left corner of the main Policy Studio window, right-click the policy you want to deploy. Select **Deploy** from the floating menu.

4393 4394

4395

4. In the Deploy window, click **OK**. Note: You may specify to deploy immediately, which we choose in our example. You may also deploy at the following day at midnight, or at a different specific date and time.

4396 4397

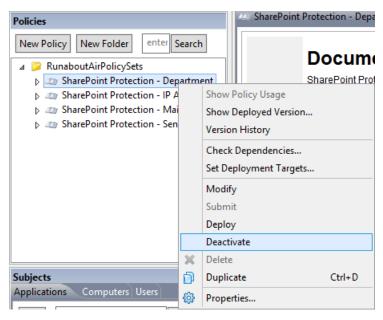

4398

4404

4405

- 5. At the bottom of the policy editing panel, verify that the **Status** is now **Pending Deployment**. This will remain for the duration of the heartbeat (described in Section 7).
- 4399 6. After the duration of the heartbeat has passed, **Status** should read as **Deployed**. This indicates that the component is actively deployed in your ABAC system.
- 4401 8.4.6 Modifying and Re-Deploying Policies and Components
- In order to modify existing policies and re-deploy them, do the following:
- 4403 8.4.6.1 Modifying and Deploying Existing Policies
 - 1. In the Policies panel in the top-left corner of the main Policy Studio window, click on the policy you want to modify. In the policy editing panel, click **Modify**.
 - a. Or, right-click the policy you want to modify and select **Modify** from the floating menu.
- 2. In the policy editing panel, make the desired changes and click **Submit**.

- 4408 3. Follow the deploy instructions from Section 8.4.5 to deploy the modified policy.
- 4409 8.4.6.2 Modifying and Deploying Existing Components
- 1. In the Components panel in the bottom-left corner of the main Policy Studio window, click on the component you want to modify. In the policy editing panel, click **Modify**.
 - a. Or, right-click the component you want to modify and select **Modify** from the floating menu.
- 4414 2. In the component editing panel, make the desired changes and click **Submit**.
- 3. Follow the deploy instructions from Section 8.4.5 to deploy the modified component.
- 4416 8.4.7 Deactivating Policies and Components
- 4417 8.4.7.1 Deactivating Policies
 - In the Policies panel in the top-left corner of the main Policy Studio window, right-click the policy you want to deactivate. Select **Deactivate** from the floating menu.

4421 2. At the bottom of the policy editing panel, note the change in **Status to Pending Deactivation**. 4422 Click **Deploy**.

3. In the Deploy window, click **OK**. Note: You may specify to deploy immediately, which we choose in our example. You may also deploy the following day at midnight, or at a different specific date and time.

4420

4412

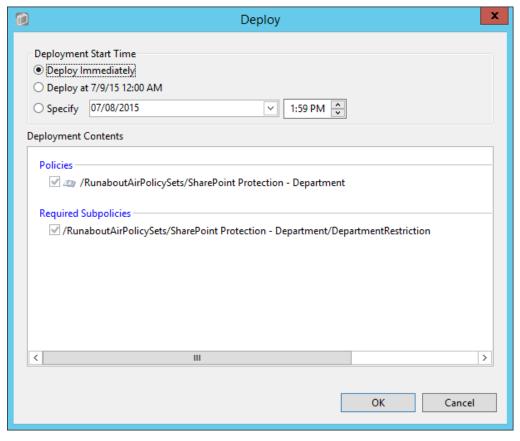

4413

4418 4419

4423

4424

4425

4429

4. Verify at the bottom of the policy editing panel that the **Status** is now **Pending Deactivation**. This will remain for the duration of the heartbeat (described in <u>Section 7</u>).

44304431

4432

5. After the duration of the heartbeat has passed, **Status** should read as **Inactive**. This indicates that the component is currently inactive in your ABAC system.

4433

4434

4435

4436

8.4.7.2 Deactivating Components

- 1. In the Components panel in the bottom-left corner of the main Policy Studio window, right-click on the component you want to deactivate. Select **Deactivate** from the floating menu.
- 2. Follow steps 2-5 in <u>Section 8.4.7.1</u> for deactivating policies.

4438 8.4.8 Deleting Policies and Components

- Note: In order to delete a policy or component, you must first deactivate the item and any related sub-
- 4440 items.
- 4441 8.4.8.1 Deleting Policies
- 1. In the Policies panel in the top-left corner of the main Policy Studio window, right-click on the policy you want to delete. Select **Delete** from the floating menu.
- 4444 2. In the Delete window, click **Yes**.

4445

4446

4447

4448

4449

4458

8.4.8.2 Deleting Components

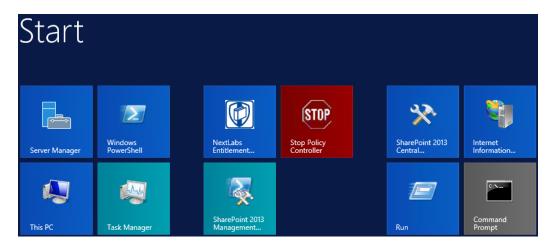

1. In the Components panel in the bottom-left corner of the main Policy Studio window, right-click on the policy you want to delete. Select **Delete** from the floating menu.

8.5 Configuring Attributes in NextLabs

- 4450 <u>Section 6</u> illustrated how to configure the attribute flow between several of the servers and components
- 4451 in the ABAC architecture. Note that the NextLabs Entitlement Manager was installed on the SharePoint
- Server, which is where all of the activity in Section 8.5 occurs.
- 4453 In order to configure NextLabs to enforce policy on all of the attributes coming from the front-channel
- 4454 as SharePoint Claims, you must first stop the NextLabs Policy Controller service, edit the
- 4455 configuration.xml file in the SharePoint Enforcer software architecture, restart Internet Information
- 4456 Services (IIS), then restart the NextLabs Policy Controller service using the following instructions.

4457 8.5.1 Stopping the NextLabs Policy Controller Service

- 1. On the SharePoint Server, click the Windows icon and begin typing the word **Services.**
- 2. Double-click on the icon to open the Services application.
- 3. Within the Services application window, in the list of services, click on the **Name** column to sort by alphabetical order, and look for **Control Center Enforcer Service.**
- 4. If the **status** of the Control Center Enforcer Service is **Running**, stop it.
- 4463 a. Click the Windows icon.
- b. Double-click the **Stop Policy Controller** shortcut icon.

c. Enter your NextLabs Administrator credentials. Then click **Stop**.

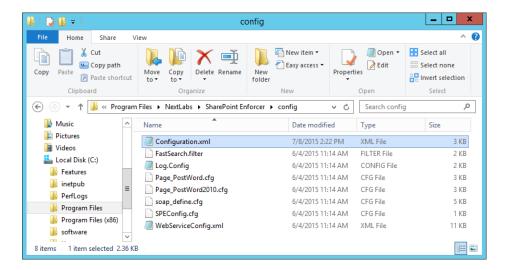

4467 4468

d. In the Stop Enforcer Service success window, click **OK**.

- 4470 8.5.2 Editing the Configuration File
- 4471 8.5.2.1 Locating and Opening the SharePoint Enforcer configuration.xml File
- 1. In Windows Explorer, find and open the SharePoint Enforcer configuration.xml file.
- a. Double-click the **C:/** drive.
- b. Double-click **Program Files.**
- 4475 c. Double-click **NextLabs**.
- d. Double-click **SharePoint Enforcer**.
- 4477 e. Double-click config.
- f. Right-click **Configuration.xml** to edit the file in a text editor.

8.5.2.2 Configuring Resource Attributes from SharePoint Metadata

- 1. Within the configuration.xml file, look for the <SPEConfiguration> tag.
- 2. Under that tag, but above a **<User Attribute>** tag, insert tags for each site-level or sub-site level resource attribute of interest.
 - a. For example, in our build we created policies based on the **department** resource attribute, so in our configuration.xml file we included the following:

```
<PropertyBag disabled="false" level="SiteCollection">

<Property disabled="false" name="department" attributename="department"
/>

</PropertyBag>

<PropertyBag disabled="false" level="SubSite">

<Property disabled="false" name="department" attributename="department"
/>

</PropertyBag>
```

b. From the example above, the top of the configuration.xml file looks like this:

4499

4500

4501 4502

4503

4504

4505

4506

4507

4508

4509

4510

4511

4512

4513

4514

4515

4516

4496 8.5.2.3 Configuring User Attributes from SharePoint Claims

Within the configuration.xml file directly under any <PropertyBag> closing tags, find the <User
 Attribute> </User Attribute> portion of the document. Initially, its default contents in that area
 may look like this, containing some default user attributes such as "emailAddress" or
 "adfsGroup":

- 2. In the **User Attribute** area, add more claims here to include all the attributes you will be expecting to evaluate in NextLabs policies for access control decisions.
 - a. For example, in our build we created policies based on users' "clearance", "department", and "ip_address", so in our configuration.xml file we included the following, among others:

```
<Claim name="department" attributename="department"
claimtype="http://schemas.xmlsoap.org/ws/2005/05/identity/claims/departme
nt" disabled="false" />

<Claim name="ip_address" attributename = "ip_address"
claimtype="http://schemas.xmlsoap.org/ws/2005/05/identity/claims/ip_addre
ss" disabled="false" />

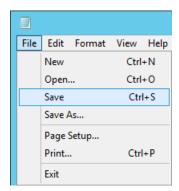

<Claim name="clearance" attributename = "clearance"
claimtype="http://schemas.xmlsoap.org/ws/2005/05/identity/claims/clearance"
claimtype="http://schemas.xmlsoap.org/ws/2005/05/identity/claims/clearance"
disabled="false" />
```

b. From the example above, the rest of our **configuration.xml** file looks like this:

```
</PropertyBag>
    <UserAttribute>
      <Claims disabled="false">
        <Claim name="upn" attributename="upn"
claimtype="http://schemas.xmlsoap.org/ws/2005/05/identity/claims/upn" disabled="false" />
       <Claim name="emailaddress" attributename="emailaddress"</pre>
claimtype="http://schemas.xmlsoap.org/ws/2005/05/identity/claims/emailaddress" disabled="false"
        <Claim name="adfsGroup"
claimtype="http://schemas.microsoft.com/ws/2008/06/identity/claims/role" prefix="ADFS_"
disabled="false" />
       <Claim name="department" attributename="department"
claimtype="http://schemas.xmlsoap.org/ws/2005/05/identity/claims/department" disabled="false" />
        <Claim name="staffLevel" attributename="staffLevel"
claimtype="http://schemas.xmlsoap.org/ws/2005/05/identity/claims/staffLevel" disabled="false" />
       <Claim name="employer" attributename="employer"
claimtype="http://schemas.xmlsoap.org/ws/2005/05/identity/claims/employer" disabled="false" />
        <Claim name="role" attributename="role'
claimtype="http://schemas.xmlsoap.org/ws/2005/05/identity/claims/role" disabled="false" />
        <Claim name="ip_address" attributename = "ip_address"
claimtype="http://schemas.xmlsoap.org/ws/2005/05/identity/claims/ip_address" disabled="false" />
       <Claim name="clearance" attributename = "clearance"
claimtype="http://schemas.xmlsoap.org/ws/2005/05/identity/claims/clearance" disabled="false" />
      </Claims>
    </UserAttribute>
  </SPEConfiguration>
```

4518 8.5.2.4 Saving Changes to the Configuration File

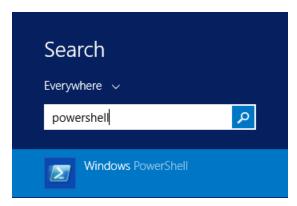

4519 1. From the File menu, click **Save**, or Ctrl+S on your keyboard.

4520

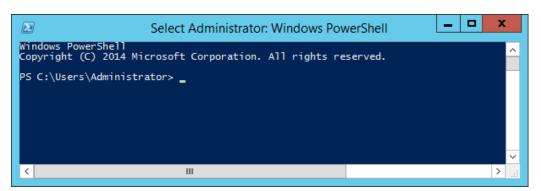

4521 8.5.3 Restarting IIS via Windows PowerShell

- 4522 1. Click the Windows icon.
- 4523 2. In the Search text box, begin typing **PowerShell**.

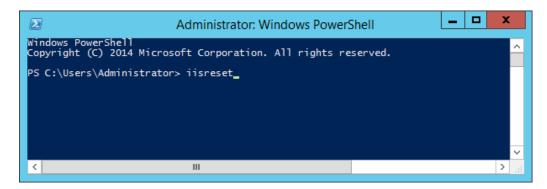

4524

4525 3. Click on Windows PowerShell.

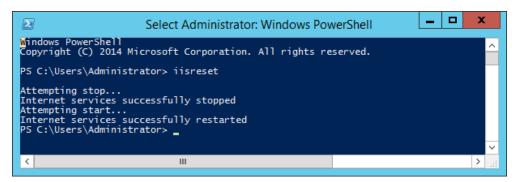

4526 4527

4. In the PowerShell window, type the command: **iisreset**. Press **Enter**.

4529

5. In the PowerShell window, verify that services stopped and restarted successfully.

4530

4531

4532

4537

4538

4539

4540

8.5.4 Restarting the NextLabs Policy Controller Service

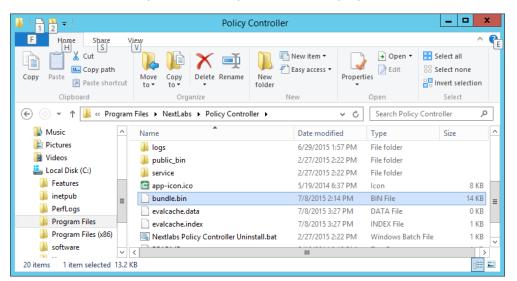

- 1. Click on the Windows icon and begin typing the word **Services.**
- 4533 2. Double-click the **Services** icon to open the application.
- 4534 3. Within the Services application window in the list of services, click on the **Name** column to sort by alphabetical order and look for **Control Center Enforcer Service.**
- 4536 4. Right-click Control Center Enforcer Service and click Start.
 - a. It may be necessary to click the **Refresh** icon in order to see the **Control Center Enforcer Service** status change to **Running**.

8.6 Functional Test

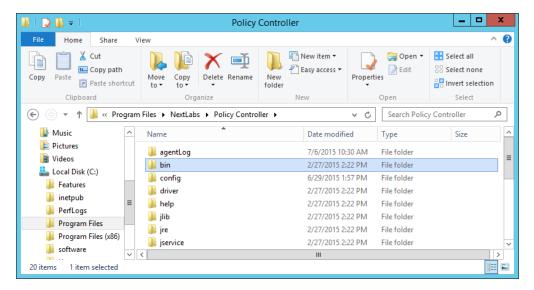

8.6.1 Updated Bin File After Policy Creation/Modification

- 4541 After a policy or component is deployed for the first time, or modified and re-deployed within Policy
- 4542 Studio on the SQL Server, an encrypted bundle.bin file on the SharePoint Server will be updated after
- one heartbeat. As explained in Section 7, on the SharePoint Server it is the responsibility of the
- 4544 Controller Manager component of the NextLabs Policy Controller (PDP) to encrypt the bundle.bin file on
- 4545 the local file system for use during policy evaluation by the PDP.
- 4546 To ensure the policy logic is being correctly sent from the NextLabs Policy Studio (PAP) on the SQL Server
- 4547 to the bundle.bin file on the SharePoint Server for use by the NextLabs Policy Controller (PDP), you can
- 4548 find the bundle.bin file and decrypt its contents to see your policy logic decrypted there.

- 4549 8.6.1.1 On the SharePoint Server Note Timestamp of the Bundle.bin File and Decrypt Its
 4550 Contents
- 4551 1. Double-click the C:/ drive.
- 4552 2. Double-click **Program Files.**
- 4553 3. Double-click NextLabs.
- 4554 4. Double-click Policy Controller.
- 5. Scroll down to find **bundle.bin** and note the timestamp in the **Date Modified** column. This would be the last time policies or components were deployed.

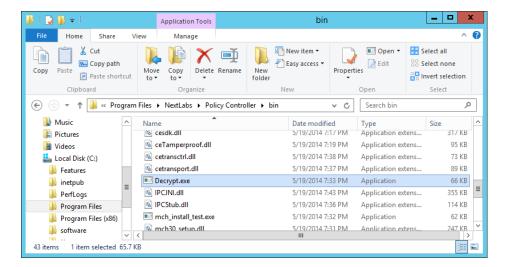

4558 6. Scroll back up and double-click on the **bin** folder.

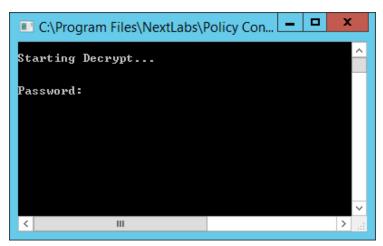

4559

4560

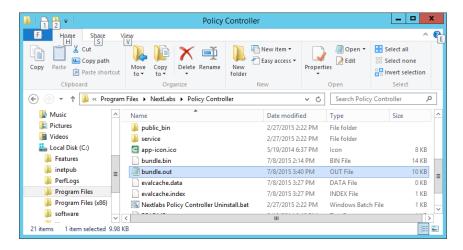

7. Scroll down to find **Decrypt.exe.**

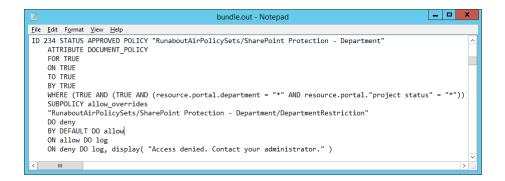

a. In the Decrypt window, enter the administrator's **Password** and press **Enter**.

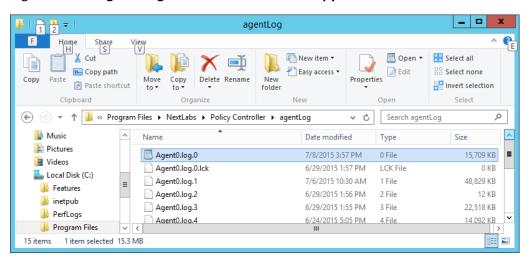

b. After the Decrypt window disappears, click on Policy Controller to return to that folder. Scroll down and double-click the **bundle.out** file.

c. In the text editor window, scroll down to find policies that you have created previously. Example: RunaboutAirPolicySets/SharePoint Protection – Department top-level policy

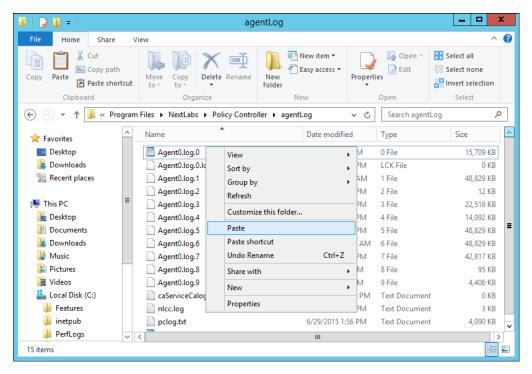

- 4570 8.6.2 Reviewing NextLabs AgentLog to Illustrate History of Access Control
 4571 Evaluations during SharePoint Access
- 4572 1. Double-click the C:/ drive.
- 4573 2. Double-click **Program Files**.
- 4574 3. Double-click **NextLabs**.
- 4575 4. Double-click **Policy Controller.**
- 4576 5. Double-click **AgentLog**.
- 4577 6. Right-click the **Agento.log.0** locked file and select **Copy**.

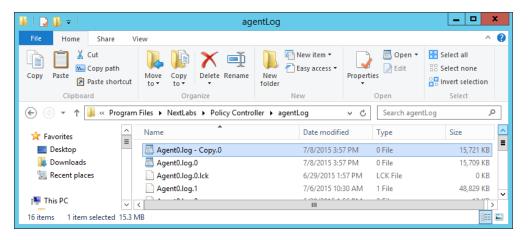

4578

4579 7. Within the agentLog folder, right-click in an empty space and select **Paste**.

4581 8. Double-click the **Agent0.log-Copy.0** file to view its contents.

4582 4583

 Scroll down to view the contents. You can press Ctrl+F to find keywords such as any identifying word from your policy definitions, words common to ABAC activity such as allow or deny, or words native to NextLabs logging such as effect =.

4585 4586

4584

a. Examples of information found in this Agent0.log-Copy.0 file:

4587

i. All of the policies evaluated during one instance of access:

4659	9 Leveraging NextLabs Control Center Reporter for Reporting				
4660	and Auditing Purposes				
4661	9.1 Introduction				
4662	In previous sections of this How-To Guide (Section 7), we installed several NextLabs products that can be				
4663	used to define and deploy Attribute Based Access Control policies and enforce decisions regarding user				
4664	access to Microsoft SharePoint resources based on user, object, environmental attributes, and the				
4665	corresponding policies in place. We also illustrated how to use and configure the NextLabs Policy Studio,				
4666	the product responsible for Policy Lifecycle Management, and discussed policy strategy and the				
4667	translation of business logic into policy (<u>Section 8</u>).				
4668	In this section of the How-To Guide, we will illustrate how to use the NextLabs Control Center Reporter,				
4669	a component of the previously installed NextLabs Control Center (Section 7), in order to generate				
4670	reports and provide a graphical user interface for prior policy evaluation and access control decisions in				
4671	your environment.				
4672	Reporter is automatically installed during the NextLabs Control Center installation, which was detailed in				
4673	Section 7. In this How-To section, we will introduce Reporter, its purpose, interface, and capabilities,				
4674	then illustrate some example uses based on our build.				
4675	9.1.1 Components Used in this How-To Guide				
4676	NextLabs Control Center Reporter v7.5.0 (64) – web application and graphical user interface for				
4677	evaluating prior policy evaluation access control decisions and generating reports for monitoring and				
4678	auditing.				
4679	9.1.2 Pre-requisites to Complete Prior to this How-To Guide				
4680	1. If you intend to do a setup without identity federation and federated logins, you must:				
4681	a. Install and configure Active Directory (see <u>Section 2</u>)				
4682	b. Install and configure Microsoft SharePoint (see Section 4)				
4683	c. Install and configure NextLabs Control Center, Policy Studio, and Policy Controller (see				
4684	Section 7)				
4685	d. Define and deploy policies based on your business rules (see <u>Section 8</u>)				
4686	2. If you intend to incorporate a trust relationship between an IdP and RP and use federated logins				
4687	into SharePoint, you must:				

SECOND DRAFT

4688	a. Install and configure Active Directory (see Section 2)		
4689	b. Setup and configure the RP and IdP (see <u>Section 3</u>)		
4690	c. Install and configure Microsoft SharePoint (see <u>Section 4</u>)		
4691	d. Configure the SharePoint federated login with the RP (see Section 5)		
4692	e. Configure the attribute flow between all endpoints (see <u>Section 6</u>)		
4693 4694	 Install and configure NextLabs Control Center, Policy Studio, and Policy Controller (see Section 7) 		
4695	g. Define and deploy policies based on your business rules (see <u>Section 8</u>)		
4696	9.2 Introduction to NextLabs Control Center Reporter		
4697 4698 4699 4700 4701 4702 4703 4704	information is being used in your environment. You can use Reporter to define and run custom queries about policy enforcement activities that are recorded in the Activity Journal, a native, automatic logging mechanism built into the NextLabs SQL database that was configured during installation of the NextLabs Control Center (Section 7). These queries are referred to as reports. Reports can be designed to answer a wide variety of questions, such as who has access to certain documents, who is using which resources and when, what types of policy enforcement is taking place, what activity occurred within a given		
4705 4706 4707 4708 4709 4710 4711	policy enforcement criteria are met. You can design monitors to cover a wide range of scenarios, such as sending an alert through email when access to a certain resource has been denied more than a specified number of times in a given time period; or when the volume of classified documents that have been downloaded in a given time period exceeds a specific file size. Together, monitors and alerts can provide continuous coverage of critical policy enforcements in an enterprise, as well as a notification system that		
4712 4713 4714 4715	Reporter is intended for use by whoever is responsible for monitoring and reporting on compliance, gathering statistics about document usage, and investigating any suspected incidents of information mishandling. This may include administrators, IT staff, managers, executives, and auditors, or any other authorized personnel.		
4716 4717 4718	User permissions are defined in the Administrator application (another component of Control Center installed in <u>Section 7</u>), by creating a new User and assigning one of the four available roles to it. By default, all roles include permission to open and use the reporting functionality of Reporter.		
4719 4720 4721	 9.2.1 Opening Reporter 1. On the server where NextLabs Control Center was installed, open a web browser (i.e., SQL Server in this build). 		

2. Enter the URL and press Enter: https://<hostname>/reporter, i.e., https://localhost/reporter

3. At the Reporter login screen, enter valid credentials, such as the Control Center Administrator account created in <u>Section 7</u>. Click **Login**.

4725

4726

4727 4728 4. In your browser, the Reporter opening view defaults to the **Dashboard** tab. The **Dashboard** tab, **Reports** tab, and **Monitoring** tab will be discussed more thoroughly in subsequent sections of this How-To Guide.

4731 4732

4733

4734

9.3 Introduction to Reporter Dashboard

The Reporter Dashboard is divided into panes, each displaying a predefined statistical view of data that provides a snapshot of policy enforcement trends. In the default configuration of Reporter, these panes display data in the following graphs (from the NextLabs Control Center Reporter User Guide, available only to customers at this time):

Graph	Description	May Indicate
Top Five Deny Policies (Month)	Pie chart representing the five Deny policies that were most frequently enforced over the previous thirty days.	 Misunderstanding of access level: users being blocked from a resource they believe they should use Incorrectly defined entitlements: users should have access, but policies are not updated or correctly designed
Top Ten Denied Users (Month)	Bar chart representing the ten users who have had the most instances of any Deny policy enforced against them.	 Users who habitually snoop into resources they are not authorized to use Incorrectly defined entitlements: users or group should have access, but policies are not updated or are incorrectly designed
Top Five Deny Resources (Week)	Bar chart representing the five resources that any users have most frequently attempted to access and been blocked by an active policy, over the previous seven days.	 Resources of broad interest to users who should not be us- ing them Incorrectly designed resource or user component, blocking users who should have access
Top Five Allow Resources (Week)	Bar chart representing the five resources that users have most frequently attempted to access and been allowed by an active policy, over the previous seven days.	 Improperly designed resource component or policies, which allow inappropriate users ac- cess to sensitive resources
Deny Policy Enforcement Trends (Month)	Bar chart representing the trend, over the previous 30 days, of the daily total instances of any deny policy being enforced on any user, for any resource.	 Progress (or lack thereof) in educating users about access policies and individual/group entitlements, at a broad level Improperly designed policies that are blocking too many users who expect and are entitled to access or use

Graph	Description	May Indicate
Recent Allows	List of details about the most recent ten instances of any allow policy being enforced against any user, for any resource. Details listed include: Date of enforcement Name of enforced policy User who triggered the policy Action that triggered the policy Resource the user was trying to access	Instances where some urgent action is required, such as users being allowed access to some resource they should not be using, due to lack of policy coverage or an incorrectly defined policy
Recent Denys	List of details about the most recent ten instances of any deny policy being enforced against any user, for any resource. Details listed include: • Date of enforcement • Name of enforced policy • User who triggered the policy • Action that triggered the policy • Resource the user was trying to access	 Instances where many users are attempting to get at data they are not authorized to use Instances where some urgent correction is required to allow appropriate access, such as multiple authorized users being blocked from some resource they need by an incorrectly defined policy
Alerts this Week: Group by Tags	Treemap representing volume of alerts in the current week. Alerts are grouped by monitor tags.	 Policies being watched by monitors that are tagged are being enforced at a rate that demands attention. Further review or action may be re- quired.
Today's Alerts: Details	List of details about the alerts raised in the current day. Details include: • Alert level • Monitor name • Alert message • Date and time the alert was raised	 Policies being monitored are being enforced at a rate that demands attention. Further review or action may be re- quired.

SECOND DRAFT

- These panels are configurable such that an administrator can choose which panels and data are visible and how they are laid out within the Dashboard according to the business's business logic, policies, and priorities.
- The data displayed in all panes of the dashboard is refreshed from the Activity Journal each time you open the Dashboard tab. This means that data is updated on demand; for example, if a pane shows some statistic for the past week, that reflects not the last seven whole calendar days, but the last seven 24-hour periods starting from the top of the current hour.

4743 9.3.1 Exploring the Dashboard

- 1. On the server where NextLabs Control Center was installed, open a web browser, i.e., SQL Server in this build
- 2. Enter the URL and press Enter: https://<hostname>/reporter, i.e., https://localhost/reporter
- 3. At the Reporter login screen, enter valid credentials such as the Control Center Administrator account created in Section 7. Click **Login**.

4749 4750

4744

4745

4746

4747

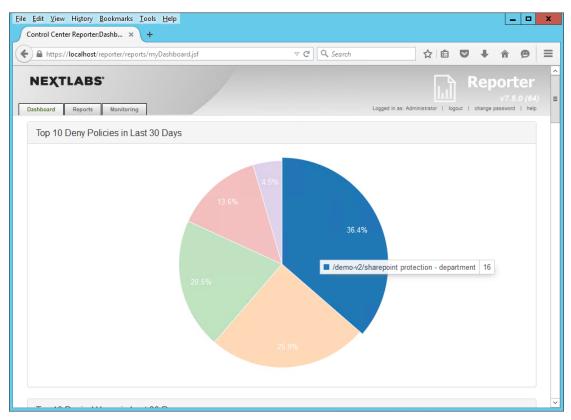

4748

4. In your browser, the Reporter will default to the **Dashboard tab**.

4752 4753

4754 4755 The charts and graphs on the Dashboard are interactive. When you move your cursor over a bar in a bar chart or a slice in the pie chart, a tooltip displays information about that value series.

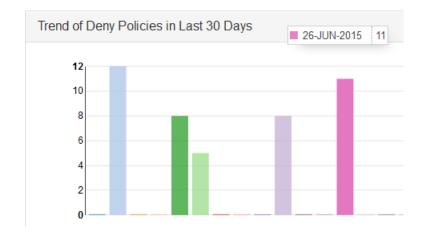

Example seen in the image below: 36.4% of the Deny policies evaluated in the last 30 days belonged to the SharePoint Protection – Department policy set.

4756 4757

4758

Another example from this build seen in the image below: in the Deny Policies trend in the last 30 days, June 26, 2015 saw an unusually large number of Deny Policies relative to other days.

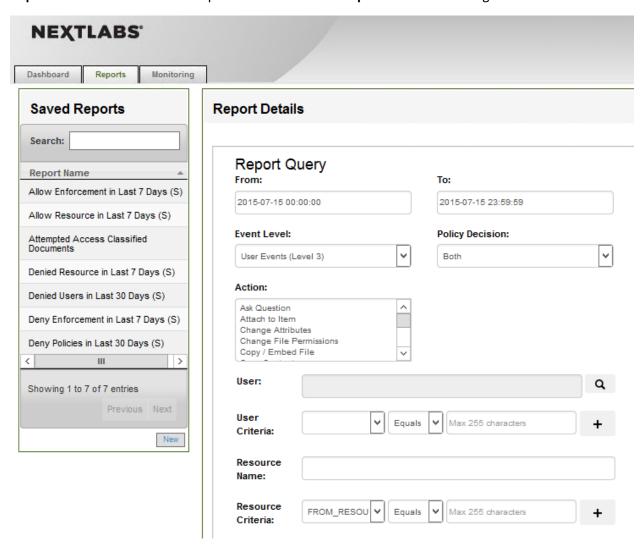

4760

4761

4762

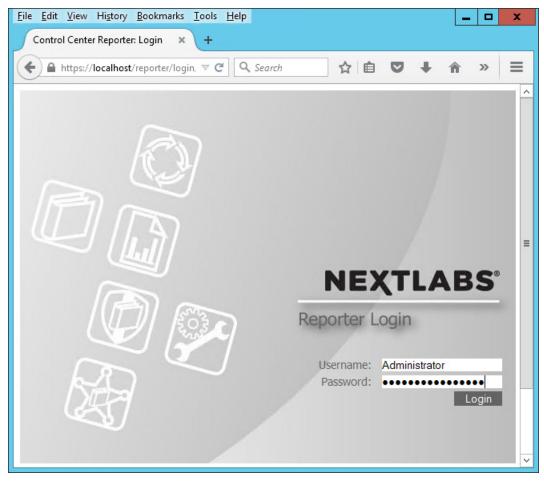

9.4 Introduction to Defining and Running Custom Reports in Reporter

In Reporter, you can define and run reports in the Reports tab. This tab is divided into two panes, **Saved Reports** on the left side of the Reports tab window and **Report Details** on the right.

SECOND DRAFT

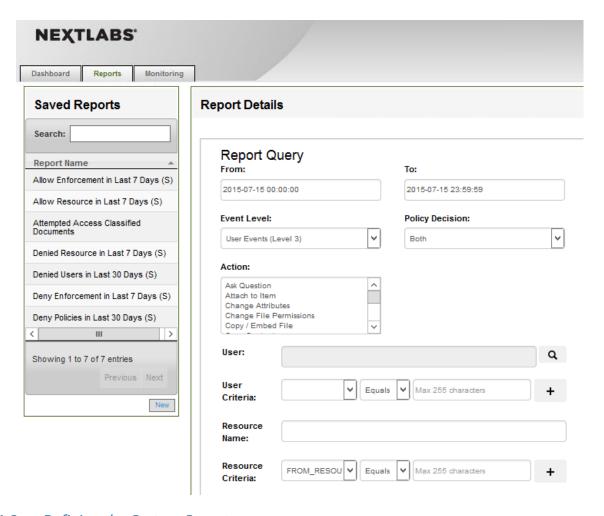

- The Saved Reports pane provides a list of all saved reports available to you. This includes all reports you create and save, all reports saved by other users and marked as Shared, and the sample reports used to generate data that is displayed in the Dashboard tab. When you click on any item in Saved Reports, the details of that report are displayed in Report Details on the right. This is also where you work when you create a new report.
- 4769 In the Report Details pane, define the following:
- 4770 the time period of the policy activity data to cover in the report
- 4771 the criteria, or filters, that determine what policy activity data to include in the report
- 4772 the output format of the report
- The default settings in Report Details display when you click the Reports tab or when you click New in
- the Saved Reports pane. By default, the time period for the report is the current day, all policy activity
- data at the user level is included, and the data is presented in table format.
- 4776 After defining a new report or editing an existing report, click **Run** at the bottom of the Report Details
- pane to view the results, which we will illustrate in the following two subsections.
- 4778 9.4.1 Defining a Custom Report
- 4779 In this subsection, we will list the standard steps for creating a custom report. In Section 9.5 of this How-
- 4780 To Guide we will illustrate some example custom report sections that demonstrate Reporter's report
- 4781 capabilities.
- 4782 9.4.1.1 Logging into Reporter
- Before being able to define a custom report, you must first log in to Reporter and click on the Reports tab as seen in the steps below:
- 1. On the server where NextLabs Control Center was installed in <u>Section 7</u>, open a web browser, i.e., SQL Server in this build.
- 4787 2. Enter the URL and press Enter: https://<hostname>/reporter, i.e., https://localhost/reporter
- 4788 3. At the Reporter login screen, enter valid credentials, such as the Control Center Administrator account created in <u>Section 7</u>. Click **Login**.

 4. In your browser, the Reporter user interface will default to the **Dashboard tab**. The Dashboard tab, Reports tab, and Monitoring tab will be discussed more thoroughly in subsequent sections of this How-To Guide.

5. Click on the **Reports tab** to open the Reports tab window.

4797

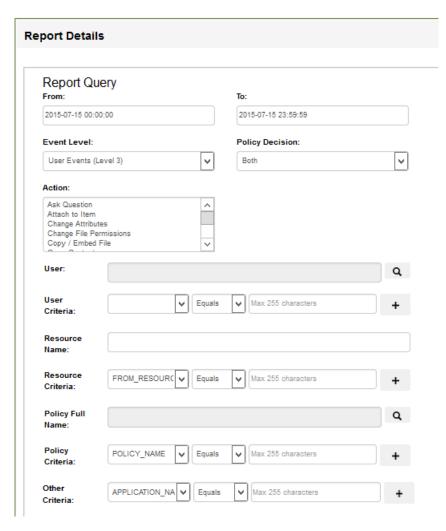

4798

4799

4800

9.4.1.2 Defining the Custom Report

In order to define a custom or new report, you must specify filters and change default settings within the Report Details – Report Query pane. If you don't specify any filters or change any of the default settings, the report retrieves all policy activity data categorized as user-level events for the current day.

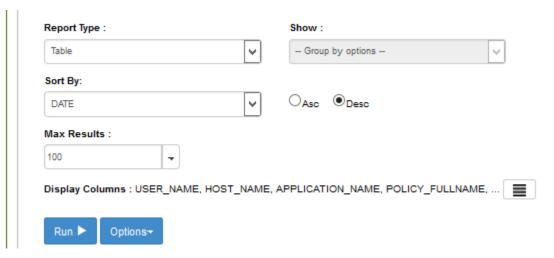

- 1. In the Report Details Report Query pane, define the report query by filling in data or using drop-down menus to define your desired report.
 - a. Note: Many of the fields are optional. Required fields contain default values.
 - i. In the From and To fields, specify the start date and time, and end date and time, respectively, of the time period you want the report to cover. Click in the field to choose a date and time from the calendar. When specifying a report period, be sure to consider the time zone where Control Center is installed, and the time period of data stored in the Activity Journal.
 - ii. In **Event Level**, select the level of event verbosity the report contains:
 - 1. User Events (default): Logged in the Activity Journal as Level 1
 - 2. Application Events (application and user-level events): Logged in the Activity Journal as Level 2
 - 3. All System Events (system, application, and user-level events): Logged in the Activity Journal as Level 3

4816 4817 4818 4819		Note: As a rule, you should leave this setting at User Events. This setting significantly reduces the amount of system noise. Application- or system-level events generally are not useful in monitoring policy or user activities.	
4820	2.	In Decision , select the type of enforcement effect to include in this report:	
4821 4822 4823 4824		a. Allow: Instances when the policy permitted the user to perform the action covered by the policy. Note that the report results always depend on what information is logged. If the policy does not have any On Allow logging obligation specified, this report will not return any On Allow data whether or not you select this option.	
4825 4826		 Deny: Instances when the policy did not allow the user to perform the action. Deny decisions are always logged. 	
4827		c. Both: All instances when the policy was enforced, with either Allow or Deny effect.	
4828 4829	3.	In Action , select the user action or actions to include in this report. The list shows all currently defined actions.	
4830 4831		 To select multiple actions, hold Ctrl and click each action. If you do not make any selections, all actions are included. 	
4832 4833		Note: Policies involving Paste actions do not support logging obligations, therefore, instances of their enforcement are not included in reports.	
4834 4835 4836	4.	In User , specify one or more users on which to filter the activity data, or leave this field blank to include all users. Use the User Lookup window (magnifying glass icon) to browse through all users currently defined in your Information Network Directory, and select the users you want.	
4837 4838 4839	5.	In User Criteria , specify additional user criteria by creating one or more conditions. Each condition consists of a user attribute, an operator, and a value. You must click the + button to add a condition to the query.	
4840 4841	6.	In Resource Path , type the network path of the resource on which to filter, or leave this field blank to include all resources.	
4842 4843 4844	7.	In Resource Criteria , specify additional resource criteria by creating one or more conditions. Each condition consists of a resource attribute, an operator, and a value. Click the + button to add a condition to the query.	
4845 4846 4847	8.	In Policy Name , specify one or more policies on which to filter, or leave this field blank to include all policies. Use the Policy Lookup window to browse through and select which policies you want to include.	
4848 4849 4850	9.	In Policy Criteria , specify additional policy criteria by creating one or more conditions. Each condition consists of a policy attribute, an operator, and a value. Click the + button to add a condition to the query.	
4851 4852 4853	10.	In Other Criteria , specify additional criteria by creating one or more conditions. Each condition consists of a general attribute (for example, host name, host IP, and application name), an operator, and a value. Click the + button to add a condition to the query.	

9.4.1.3 Setting the Custom Report Display Options

Within the Report Details – Report Query pane, directly below the Other Criteria filter, continue with these steps to set the display options for your custom report:

1. In **Report Type**, select the output format in which to display the data: Table, Bar Chart,
Horizontal Bar Chart, or Pie Chart. Use a table to display policy activity details in a row-andcolumn format. Use a chart to display a summary of policy activities.

4861 2. If you selected one of the charts in Report Type, in **Show**, select a grouping option. Grouping is not available to a table.

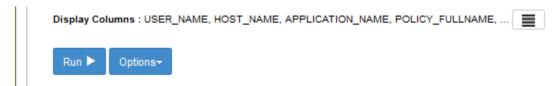

- a. Group by User: The chart shows the number of enforcement events for each user covered by the report.
- b. Group by Resource: The chart shows the number of enforcement events for each resource covered by the report.
- c. Group by Policy: The chart shows the number of enforcement events for each policy covered by the report.
- d. Group by Month: The chart shows the number of enforcement events for each month covered by the report. Select this option only if the time period you specified spans more than one month.
- e. Group by Day: The chart shows the number of enforcement events for each day covered by the report.
- 3. In **Sort By**, select a field on which to sort the data, then select Asc to sort in ascending order or Desc to sort in descending order. If the report is a table, you can sort the data by any attribute. If the report is a chart, you can sort either by the grouping item (user, resource, policy, month, or day) or by Result Count (the number of enforcement events for each user, resource, policy, month, or day).
- 4. In **Max Results**, specify the maximum number of results to display in the table or chart. For charts, this number represents the maximum number of bars in a bar chart, or slices in a pie

- chart. For readability reasons, charts should display a limited number of bars or slices. For a table, the number represents the maximum number of rows (each row represents an event).

 Tables that show a large number of rows present the data on multiple pages.
- 4884 5. In **Display Columns**, select the columns to display in a table. This setting applies to tables only.
 4885 USER_NAME, POLICY_FULLNAME, POLICY_DECISION, HOST_NAME, and APPLICATION_NAME
 4886 are selected by default. To remove any of those columns or to add other columns, click and
 4887 use the arrow icons to move columns out of, or into, the Selected pane.

4888 9.4.2 Running a Custom Report

- Directly beneath the filters and data fields for defining the report and setting its display settings, do the following in order to run the report and/or save it for the future:
- 4891 1. At the bottom of the Report Details Report Query pane, click **Run** to generate the new report.

4892 4893

2. If you want to run this report again in the future, save the report. Click **Options**, and select **Save**.

9.5 Example Custom Report and Available Formats

In this section, we will present examples of different report formats, all representing a small set of event data, returned by the same custom report from our build. By comparing the example formats, you will gain a better understanding of the way the different formats can be used to highlight different aspects of the same data depending on your business rules or priorities.

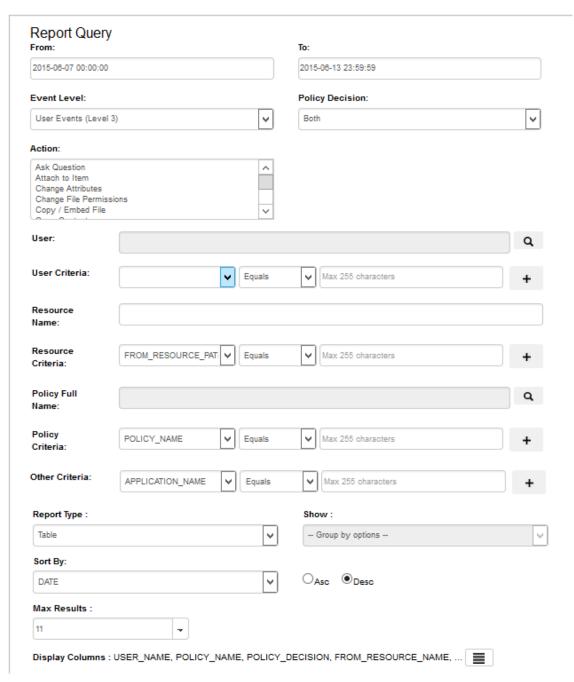

The custom report used in this section will result from a query that requests all events by users on all resources for one week (June 7, 2015 to June 13, 2015). We include columns that are relevant for our example business logic and the ABAC policies we put in place in Section 8. For example, we chose to include the "Department" and "Sensitivity" columns, which were custom attributes in the metadata we added to the documents uploaded to the RP's SharePoint sites.

9.5.1 Defining the Example Custom Report

9.5.1.1 Customizing Report Query Fields for this Report

1. In the Report Query pane, change the fields for the **From** and **To** date to match the desired query for the week of June 7, 2015 to June 13, 2015.

- 4909 2. In the Report Query pane, click on the **Max Results** field to open the drop-down menu. We chose 11 for demonstration purposes.
 - 3. In the Report Query pane, leave the rest of the fields in the default query settings.

4912

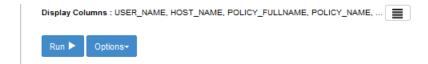

4913

4914

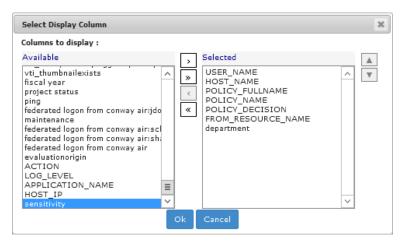

4915

9.5.1.2 Editing the Columns for Custom Views

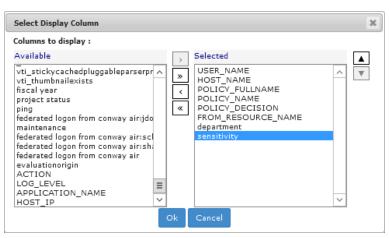

1. Toward the bottom of the Report Query pane, click on the columns icon at the end of the Display Columns line of text to open the Select Display Column window.

2. In the Select Display Column window, in the **Available** attribute list, review standard attributes (i.e. Action, Log_Level, Host_IP, etc) and custom attributes (department, sensitivity).

- 3. Click on any available attribute of interest to highlight it, then click the single right arrow button to add it to the list of **Selected** attributes.
- 4922 The attribute name will move from the **Available** list to the **Selected** list.
- **Note**: Attributes can be added and removed individually by using the single arrow buttons between lists, or as a group by using the double arrow buttons between lists.

9.5.1.3 Running the Report Query

1. At the bottom of the Report Query pane, click **Run** to run the query. (**Tip**: You can click on **Options** and **Save** or **Save As** to save the query for future use.)

SECOND DRAFT

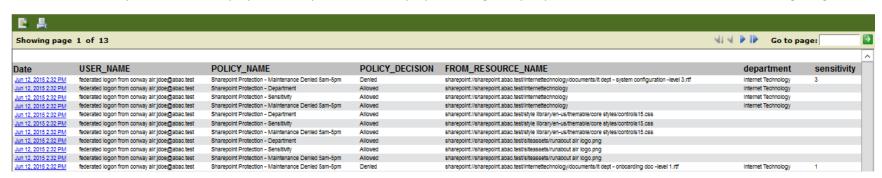

4929 4930

2. Scroll down in your browser window to see the Results pane illustrated in the following section.

4931 9.5.2 Format: Table of Event Data

4932 The default results pane with the display columns you selected displays showing the query results. This is illustrated in the following image.

4933

4939

4940

4941

4942

4943 4944

4945 4946

4947

4948

- 4934 This excerpt from the guery results shows that:
- 4935 13 pages of policy enforcement events were logged.
- 4936 All events in this excerpt occurred on June 12, 2015 (as illustrated in the **Date** column).
- Each event from this excerpt was triggered by the same user, who had logged in with a federated identity from the IdP (Sections 2 through 5)
 - Each event corresponds to one of three policies: SharePoint Protection Sensitivity, SharePoint Protection Maintenance Denied 5am-5pm, or SharePoint Protection Department.
 - Five resources were involved:
 - The first row shows that the resource was an .rtf document from the Internet Technology department's SharePoint sub-site, marked at sensitivity level 3.
 - The second through fourth rows show that the resource was the Internet Technology department site.
 - The fifth through seventh rows show that the resources were the underlying .css style sheet and logo used on the SharePoint site.
 - The seventh through tenth rows (up to the second to last) show that the resources were the underlying .css style sheet and logo used on the SharePoint site.
 - The eleventh and final row from this excerpt shows that the resource was another .rtf document from the Internet Technology department SharePoint sub-site, marked at sensitivity level 1.

SECOND DRAFT

- In the case of three out of the five resources, the enforcement decision was Allow, as shown in the fourth column (second through tenth rows).
- In the case of two out of the five resources, the enforcement decision was Deny, as shown in the fourth column (first and last rows).
- 4953 Keep these details in mind as you analyze the data in the following charts.

4954 9.5.3 Format: Bar Chart Grouped by Policy Chart

4955 Grouping events by policy is useful for identifying policies that are being triggered with unexpected

4956 frequency, which may be an indication that they are improperly designed and cover users, resources or

4957 actions that they should not. It can also indicate concentrated efforts at unauthorized data access. To

4958 examine the latter possibility, it is often helpful to switch to the Group by User option in order to focus

on who is performing the activity, as seen in Section 9.5.2.

9.5.3.1 Customizing the Display Settings

- 1. Using the Report Details Report Query window from <u>Section 9.5.2</u> for displaying the results in **Table** format, make the following edits to display results in a **Bar Chart** grouped by **Policy**:
 - a. From the Report Type list, select Bar Chart.
 - b. From the **Show** list, select **Group by Policy**
 - c. From the **Sort By** list, select **Policy**.
- d. From the **Max Results** list, choose a number or type one in the field.

<u>Example</u>: The value 6 means that our bar chart will display up to six policies, including but not limited to the number of policies displayed in the Table format.

e. Click on the **Asc** (Ascending) radio button to set the sorting order.

4970

4972

4959

4968

4969

4971 9.5.3.2 Running the Report Query

1. At the bottom of the Report Query pane, click **Run** to run the query

4973

4975

4976

4977

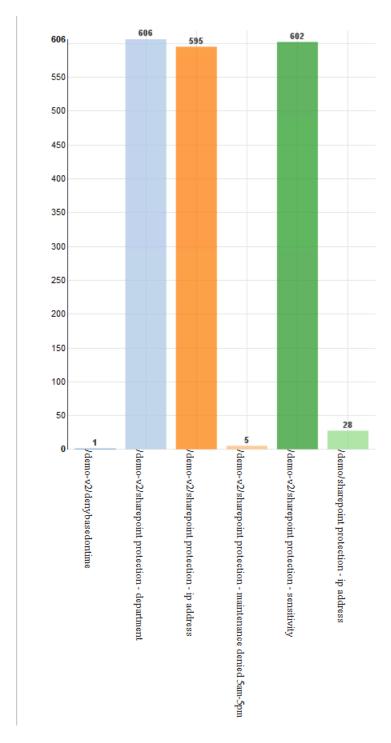

4978

4979

4974 9.5.3.3 Viewing the Results as a Bar Chart Grouped by Policy

1. In the same browser window, scroll down if necessary. Under the **Run** button, review the resulting Bar Chart Grouped by Policy.

As illustrated below, hundreds of enforcement decisions were logged during the week, and the three most commonly evaluated policies include two that were included in the table from Section 9.5.2, formatting results by Table.

9.5.4 Format: Bar Chart Grouped by User Chart

When the same data is grouped by user, and the bar chart is selected, the following chart is generated. As noted previously, the four policies were each triggered by a different user, so the graph shows four bars—each representing one user. Each is labeled with a user name. In this example, the bars are the same height, since each of the four users triggered a policy once.

4989

5008

5009

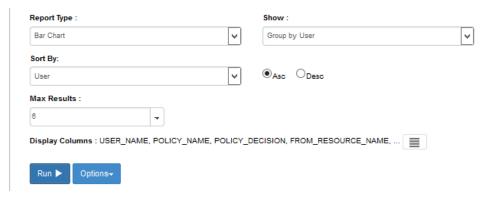

5010

4986 9.5.4.1 Customizing the display settings

- 1. Using the same Report Details Report Query window from the previous subsection, make the following edits to display results in a Bar Chart Grouped by Policy.
 - a. From the Report Type list, select Bar Chart.
 - b. From the **Show** list, select **Group by User**.
 - c. From the **Sort By** list, select **User**.
 - d. From the **Max Results** list, choose a number or type one in the field.

<u>Example</u>: The value 6 indicates that this will be the maximum number of users reflected in our Bar Chart.

e. Leave Asc selected.

4997 9.5.4.2 Running the Report Query

1. At the bottom of the Report Query pane, click **Run** to run the query.

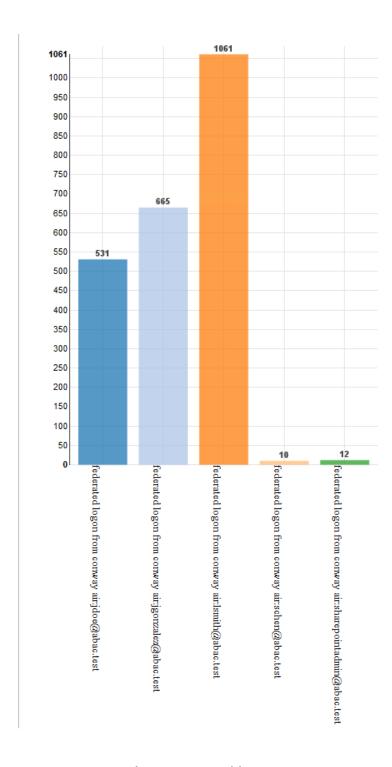

5000 9.5.4.3 Viewing the Results as a Bar Chart Grouped by User

1. In the same browser window, scroll down if necessary. Under the **Run** button, review the resulting Bar Chart Grouped by User:

As illustrated below, only five users were accessing the protected RP SharePoint resources during this week period, and all logged in via federated identity from the IdP.

- Two users had very minimal activity logged during this week: schen@abac.test and sharepointadmin@abac.test
- Two users had relatively similar activity logged during this week: jdoe@abac.test and jgonzalez@abac.test
- One user had an extremely large amount of activity logged during this week: lsmith@abac.test

9.5.5 Format: Pie Chart Grouped by Resource

The Group by Resource option shows the extent of specified events—in this case, policies being triggered—per individual resource covered by the report.

Because policies often cover large numbers of individual documents or other resources, grouping by resource is only helpful when the number of events has already been narrowed down to a smaller set by various report filters, such as policies or users. A pie charts is ideal here, because in the context of

5023

5024

5025

5039

5040

5041

5042

resource use, the *relative* access activity regarding some single file or other resource as compared to all others is generally of more interest than any *absolute* number of instances of access.

5020 9.5.5.1 Customizing the Display Settings

- 1. Using the same Report Details Report Query window from the previous subsection, make the following edits to display results in a Bar Chart grouped by Policy
 - a. From the **Report Type** list, select **Pie Chart**.
 - b. From the **Show** list, select **Group by Resource**.
 - c. From the **Sort By** list, select **Resource**.
 - d. From the **Max Results** list, select a number or type one.

<u>Example</u>: The value 10 means that will be the maximum number of resources displayed in our Pie Chart.

e. Leave Asc selected.

5031 9.5.5.2 Running the Report Query

1. At the bottom of the Report Query pane, click Run to run the query.

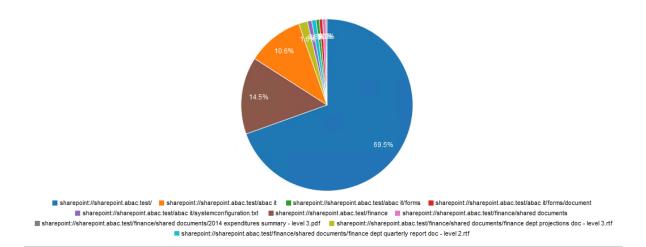

5033 9.5.5.3 Viewing the Results as a Bar Chart Grouped by User

1. In the same browser window, scroll down if necessary. Under the **Run** button, review the resulting Bar Chart Grouped by Policy:

As illustrated below, the maximum of ten resources are displayed in the pie chart.

- The most commonly accessed resource during this week period (69.5%) was our build's SharePoint home page.
- The two second-most accessed resources during this week period were the ABAC IT department and its forms sub-site (where documents are stored).
- The remaining seven most-accessed resources during this week after the top three have relatively very minimal access, and the majority of those are documents that belong to

specific department sub-sites, such as Finance Dept Quarterly Reports, IT Dept System Configuration documents, etc.

9.6 Further Example Custom Reports from Our Build

In this section, we will illustrate how to define custom reports that will provide a graphical representation of particular kinds of activity that could be of interest to our RP business.

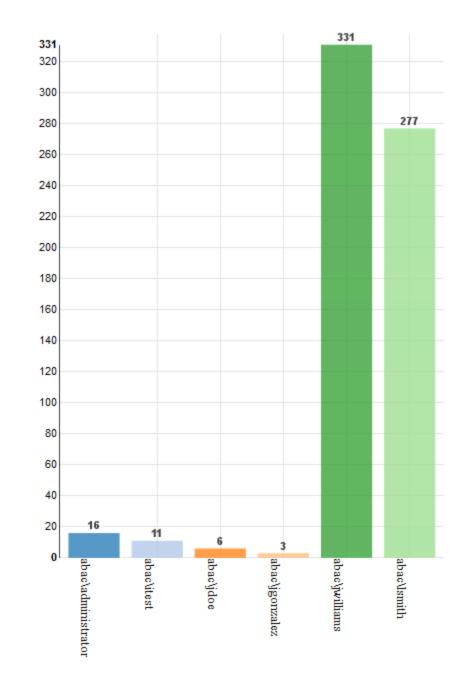

For our first additional example, we will use a fictitious user from our build's IdP and check her activity on the RP SharePoint site within a specific time period. The report we define will focus on the user Lucy Smith (username: **Ismith**) and all of her Allowed and Denied access during a specific timeframe, such as May 1, 2015 – June 30, 2015.

For our second additional example, we will use a document on the RP SharePoint site that has been marked with a metadata attribute called sensitivity. The document's sensitivity value is set to 3, which according to our example ABAC policies requires that 1) the user accessing the document belongs to the same or appropriate department for accessing it, 2) the access occurs during regular business hours Monday-Friday, and 3) the user has a clearance attribute value of **Top Secret**. The report we define will focus on the access attempts on that document for the months of May and June 2015.

9.6.1 Custom Report Illustrating All Access for One User During a Two-Month Period

- 1. Follow the steps for <u>Section 9.5.4</u>, Format: Bar Chart Grouped by User, and change the **From** field to May 1, 2015 and the **To** field to June 30, 2015.
- 2. Within the browser, in the results area at the bottom of the Report Details window, click on the vertical bar that represents the user lsmith@abac.test or abac\lsmith (light green, the far-right bar in our chart below).

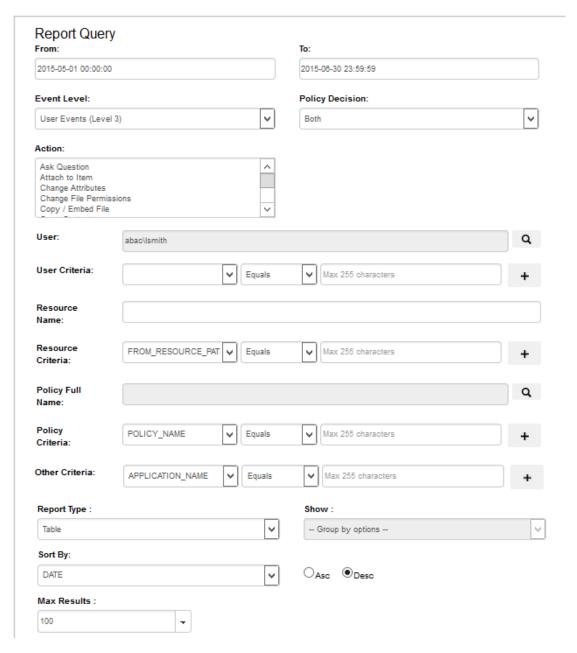

The Report window of your browser will automatically refresh, and a default query on the User will run automatically.

5069 5070

5071 5072 3. Within the browser window, scroll up to Report Details and verify that the User: field was automatically populated with **abac\lsmith**.

In the Report Query pane, you will see that the default query pertaining to the User has a Report type of Table, sorted by date in descending order, with a maximum of 100 results.

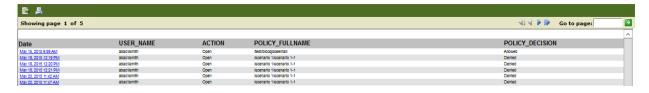

5074

5075

4. Within the browser window, scroll back down to the resulting Table to review its data. See the excerpt below.

If desired, you can change the Display Columns, Report Type, etc. to customize your view as illustrated in previous subsections.

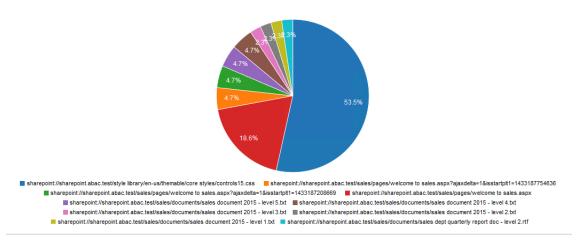

9.6.2 Viewing Access Attempts on Individual Resources

This section provides instructions for creating a custom report that shows the access attempts of a single resource for a period of two months.

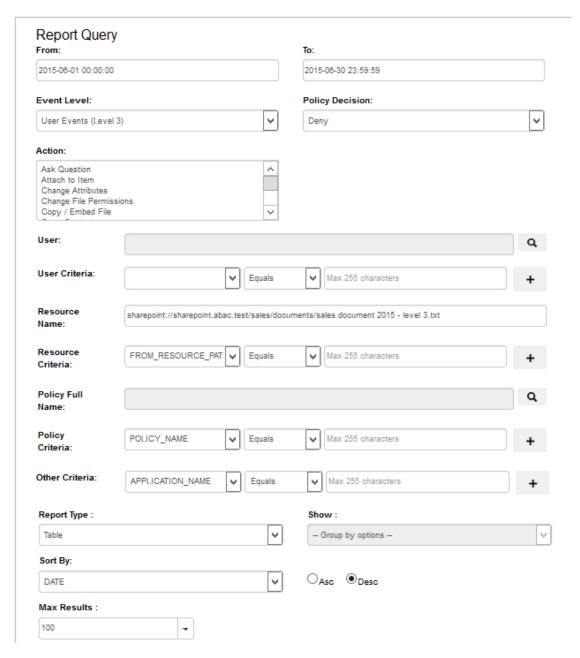

- 1. Follow the steps for <u>Section 9.5.5</u>, Format: Pie Chart Grouped by Resource, and change the **From** field to May 1, 2015 and the **To** field to June 30, 2015.
- 2. From the resulting list of resources under the pie chart, find the color of a resource with a name including **level 3**, which according to our schema means in SharePoint metadata the sensitivity level attribute is equal to 3.
- 3. Click on that resource in the pie chart (example: light pink area of 2.3% is for a Sales Dept document called sales document 2015 level 3.txt).

This will begin an automatic default query for that resource similar to the one done above based on the user **Ismith**.

 4. Within the browser window, scroll up to Report Details and verify that the Resource Name: field was automatically populated with the name **Sales document 2015 – level 3.txt**.

In the Report Query pane, you will see that the default query pertaining to the resource has a Report type of Table, sorted by date in descending order, with a maximum of 100 results.

5. Within the browser window, scroll back down to the resulting table to review its data. See the excerpt below.

If desired, you can change the Display Columns, Report Type, etc. to customize your view as illustrated in previous subsections.

10 Configuring a Secondary Attribute Provider

This section provides a description of the architecture, compilation, and deployment instructions for a secondary attribute provider and its components, which we describe as a custom Policy information point (PIP), to be included as part of the ABAC infrastructure. We also demonstrate how to configure the Relying Party server to accommodate the custom PIP and its component JIT provisioning mechanism. The secondary attribute provider comes into the picture when a user tries to access a resource at the Relying Party's Resource Provider, and the Policy decision point (PDP) finds that an essential attribute needed to make the access control decision is missing from the initial set of attributes sent from the Identity Provider. In our build, this would mean a user with a federated identity (via PingFederate Identity Provider, IdP, augmented with two-factor authentication by RSA AA) has already logged into Microsoft SharePoint (Relying Party's Resource Provider), but when trying to open a particular resource on the site, the NextLabs Policy Controller (PDP) makes a run-time decision that additional subject attributes are needed before the access decision can be made. The PDP determines this while evaluating the existing ABAC policies (created in the NextLabs Policy Studio, PAP in our ABAC build) against the user, resource, and environmental attributes at play at the time of requested access. Providing the secondary attribute collection capability in our build required the implementation of new components and related features, which we will describe more in detail later in the section: NextLabs Policy Information Point (PIP) Plugin to extend the NextLabs Policy Controller (PDP) when additional attribute(s) are needed Protocol broker to initiate and receive a SAML attribute query and SAML response Custom data store plugin for PingFederate on the Relying Party (RP) server which will cache attributes in order to limit the number of secondary requests to the PingFederate Identity Provider (IdP) server Apache Directo	5103	10.1 Introduction
Relying Party's Resource Provider, and the Policy decision point (PDP) finds that an essential attribute needed to make the access control decision is missing from the initial set of attributes sent from the identity Provider. 5138 10.1.1 Pre-Requisites

- 5139 In order to follow the instructions of this How-To section, it is necessary that seven of the previous How-
- 5140 To sections have been successfully completed. The required components that must be installed and
- 5141 configured before continuing in this How-To section include:
- Installation and Configuration of Active Directory (Section 2)
- Installation and Configuration of RSA AA (Section 2)
- Installation and Configuration of RSA AA Plugin (Section 2)
- Installation and Configuration of PingFederate on both the RP and IdP federation servers (Section 2 and Section 3),
- 5147 Installation and Configuration of Microsoft SharePoint (Section 4 and Section 5)
- Configuration of the attribute flow (Section 6)
- Installation and Configuration of NextLabs Control Center, Policy Studio, Policy Controller, and Entitlement Manager for SharePoint Server (Section 7)

5151 10.1.2 Criteria for Secondary Attribute Collection

- At the time of ABAC policy evaluation, required attributes may not be available or the system may not find it appropriate to use for various reasons, including, but not limited to:
 - For security and privacy purposes it is not ideal to acquire all known attributes for a subject
 when the session is created. Some attributes maybe PII or of higher sensitivity and should not be
 sent to the relying party until an access request made by the user requires those attributes.
 - Depending on the longevity of a session, attributes risk becoming stale. Because of this potential
 for staleness, it is essential to procure attributes as needed, depending on the freshness criteria
 established by the system. The freshness of attributes is sometimes guided by the policies
 established for a local cache.
 - The attribute needed for a specific attribute request may not an attributed owned by the Identity provider but rather may need to be acquired from an external party attribute provider.

5163 **10.1.3** Components

5171

5172

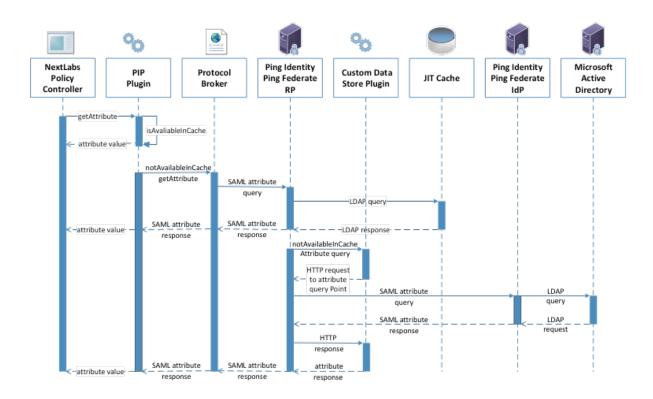

5173

- The custom PIP described in this section is composed of four new components and mechanisms which interact or integrate with different existing components in our ABAC build as extensions, plugins, or web applications:
 - NextLabs Plugin: This plugin extends the NextLabs Policy Controller to make attributes available based on the criteria mentioned in Section 10.1.2, when the PDP determines that attribute values needed to evaluate an ABAC policy are insufficient or unavailable. Following the recommendation in the software development framework provided by NextLabs, the NCCoE implemented this PIP plugin in Java, and deployed the plugin within the NextLabs Policy Controller software architecture on the server we call SharePoint server in our build. Due to the requirements of the Policy Controller architecture, the plugin can request the values of multiple missing attributes sequentially, one at a time.

- Protocol Broker: This agent, in the form of <u>servlet</u> local to the NextLabs installation, is responsible for facilitating communication between the NextLabs PIP Plugin and the PingFederate RP server following an Assertion Query/Request SAML2 Profile. This web application is deployed on a tomcat server that listens on localhost(127.0.0.1) and only communicates using https with mutual TLS. Similar to the NextLabs PIP Plugin, this component is also installed on the SharePoint server.
- Ping Custom Data store: This custom data store is an extension built using Ping SDK. It enables the RP server to query the IdP server and coordinates resulting attribute values back to the RP. When it is chained with a built-in data store to query JIT Cache (LDAP), it enables RP to provide data from and configuration to various data stores (JIT in this build). This helps the custom data store to query and coordinate the result from local JIT and remote Active Directory at the PingFederate IdP.
- Just-in-Time provisioning is a feature provided by PingFederate to store attributes of a subject for a limited time. We implemented JIT provisioning using ApacheDS. ApacheDS 2.0 is an embeddable, extendable, standards compliant, modern LDAP server written entirely in Java, and available under the Apache Software License. It also supports network protocols like Kerberos and NTP. PingFederate RP acts as an IdP for the secondary attribute provider. To fulfill in this role, the PingFederate administrative console provides mechanisms to configure SP and IdP connections. These configurations manage connection settings to support the exchange of federation-protocol messages. It also allows configuration of data stores within the connection and an attribute contract that acts as the medium to convey attribute mapping from one entity to another.

10.1.3.1 Sequence Diagram of Custom PIP Component Interactions

Figure 10-1 Architecture

10.1.3.1.1 Description

Nextlabs PDP (Policy Controller) is the arbitrator for all access decisions at the SharePoint portal. It controls access to SharePoint URL(s) by evaluating rules against the attributes of the entities (subject and object), actions, and the environment relevant to a request. It may be possible that the attribute required for the decision is not available at run time. In that case, it looks for the registered plugin that will fetch the attribute using the following flow:

- 1. When the policy controller does not receive the attributes required to make a decision, a secondary attribute request will be initiated by calling the PIP Plugin.
- 2. PIP Plugin is a registered plugin with the NextLabs Policy Controller. It implements the interface dictated by the NextLabs software. By virtue of this implementation, it receives the subject and name of the attribute that is required for the policy decision.
- 3. When the subject and attribute name are received, the PIP Plugin checks its local short-term cache (in this build, configured to hold values for two seconds) to see if the needed attribute for the subject was recently requested.
- 4. If the attribute is still in cache, the value is returned to the Policy Controller. If the value is not in cache, the PIP Plugin initiates an HTTPS request to the Protocol Broker.

5221

5223

5224

5225

5226 5227

52285229

5230

5231

5232

- 5. The Protocol Broker receives the attribute name and subject from the HTTPS request and forwards them as a signed SAML 2.0 Attribute Query to PingFederate-RP on a channel protected by mutual TLS.
- 5219 6. Once PingFederate-RP receives the SAML 2.0 attribute query, it sends an LDAP request to the JIT cache to see if the attribute was previously queried in a secondary request.
 - 7. If the subject does not have the attribute value assigned in the JIT cache, PingFederate-RP will forward the subject and attribute name to the Custom Data Store plugin. The Custom Data Store plugin acts as a pointer back to the PingFederate-IdP. To do this, the Custom Data Store dispatches an HTTPS request to the PingFederate-RP with the PingFederate-IdP as the attribute query point.
 - 8. Ping Federate uses an HTTPS query to form a SAML 2.0 attribute query and dispatch it to the Ping Federate at the IdP.
 - 9. The Ping Federate at the IdP accepts the SAML 2.0 request, verifies if the user has the attribute of need, and replies back to the PingFederate-RP with a SAML 2.0 response.
 - 10. PingFederate-RP validates the SAML 2.0 response, retrieves attribute values, and responds to the original Custom Data Store HTTP request with the attribute values.
 - 11. The Custom Data Store then responds to the PingFederate-RP attribute request with an attribute response.
- 5234 12. The PingFederate-RP constructs a SAML 2.0 response and sends it to the Protocol Broker.
- 13. The Protocol Broker retrieves the attribute or exception from the SAML 2.0 response and
 forwards it to the NextLabs plugin, which passes the attribute or exception back to the Policy
 Controller.

10.2 Component Software and Hardware Requirements

Component	Server where component is installed	Compilation method	Required software or hardware	Operating System	Optional Soft- ware
Ping Cus- tom Data Store	PingFederate RP server	Ant 1.9.2	PingFederate 7.3.2; Java version same as PingFederate in- stalled	Windows Server 2012	
NextLabs Plugin	SharePoint server	Apache Maven 3.2.5	SharePoint 2013; NextLabs Entitlement Manager for Share- Point Server, NextLabs Policy Con- troller, NextLabs Con- trol Center, NextLabs Policy Studio; SQL Server 2012; Java ver- sion same as NextLabs Policy Con- troller installed (1.6)	Windows Server 2012	BareTail (used here as a log file annotator) Copy- right Bare Metal Software Pty Ltd. Download 05/22/2015.
Protocol Broker	SharePoint server	Apache Maven 3.2.5	PingFederate 7.3.2; SharePoint 2013; NextLabs Entitlement Manager for Share- Point Server, NextLabs Policy Con- troller, NextLabs Con- trol Center, NextLabs Policy Studio; SQL Server 2012;	Windows Server 2012	
Apache Directory Server		N/A	PingFederate 7.3.2; Java 7.0 (recommended by Oracle's JDK. Some issues have been reported with Java 8); 384 MB of memory by default, can be changed using Apache Directory Studio (included)	Windows Server 2012

10.3 Ping Custom Data Store

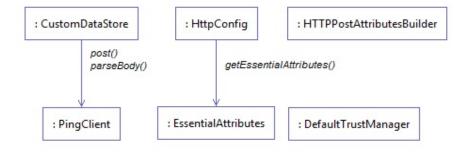

5240 10.3.1 Functionality and Architecture

This data store was developed according to the guidelines from the Ping Identity provided here. It has three functionalities:

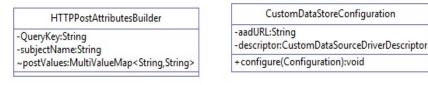

- Configuration
 - HttpConfig class is used to read in a configuration file for the custom data store.
 Configuration parameters, like truststore location, password and attribute names can be defined in a file and read in as a configuration by HttpConfig class. The structure of the HttpConfig class configuration is based on spring annotation.
 - Other sets of configuration can be read via a web interface. A detailed description of these parameters is provided in step 9 of Section 10.3.4 in this how-to guide.
- Communication
 - Similarly, dispatching the http request relies on PingClient class. PingClient uses classes
 under the <u>spring</u> http package. PingClient sends an https query to Attribute Query End Point.
 All of the parameters for the https URL are provided by the web interface.
- Custom Data Store
 - CustomDataStore is a class that implements com.pingidentity.sources.CustomDataSourceDriver.
 - It implements all methods specified by the contract, i.e.:
 - boolean testConnection(): This method tests whether a host and port is reachable or not. It is assumed that if host and port is reachable, a URL will be available.
 - java.util.List<java.lang.String> getAvailableFields():
 - java.util.Map<java.lang.String,java.lang.Object> retrieveValues(
 java.util.Collection<java.lang.String> attributeNamesToFill,
 SimpleFieldList filterConfiguration)

The Class Structure and their interactions are provided in the Interaction Diagram and Class Diagram.

5269 10.3.2 Deploying the Ping Custom Data Store

Note: PingFederate <u>administrator's manual</u> provides detailed steps for every platform. In our build, we used the Windows Server 2012 platform.

- 1. Log on to the PingFederate RP server.
- 5273 2. Click on the Windows icon and begin typing **Services.**
- 5274 3. Double-click the Services application icon.
- 5275 4. Click on the Name column to sort by alphabetical order, and look for **PingFederateService**.
- 5276 5. If the status column reads running, right-click on PingFederateService and click Stop.
 - 6. Prepare environment based on <u>PingFederate documentation</u>. This may involve going to ../pingfederate-7.3.0/pingfederate/sdk folder
- 5279 7. Click on the Windows icon and begin typing **Cmd.**
 - 8. Double-click the icon to open the Command Prompt.

5268

5270 5271

5272

5277

5278

5280

NIST SP 1800-3C: Attribute Based Access Control

- 9. In Command Prompt, navigate to your installation of PingFederate and its sdk folder by typing the following command and pressing Enter. Example: cd C:/pingfederate-5283 7.3.0/pingfederate/sdk/
 - 10. Within the sdk folder, locate **build.local.properties** and open it with your default text editor. For example, enter the following command and press Enter: **notepad build.local.properties**
 - 11. In your default text editor (Notepad in our example), set or update target-plugin.name to idp-query-data-store, i.e., # Please set the 'target-plugin.name' property to the name of the directory (under plugin-src) that # contains the source code of the plugin you want to build.
 - target-plugin.name=idp-query-data-store
 - 12. Within the Command Prompt window, navigate to your **idp-query-data-store** folder by entering a cd command with a path to your **idp_query_data_store** and pressing Enter. Example: **cd C:/--path-to-your-idp_query_data_store**
 - 13. Within the Command Prompt window, copy idp-query-data-store along with all subfolders to your PingFederate installation's sdk/plugin-src folder by entering a cp command and pressing Enter. Example: cp -rf idp_query_data_store C:/pingfederate-7.3.0/pingfederate/sdk/plugin-src
 - 14. Within the Command Prompt window, run the following command and press enter in order to make sure all relevant subfolders exist: **Is -ltr ./idp-query-data-store/**
 - a. Example results from the above command:

```
5300 total 4
5301 drwxrw-r--. 3 t... t.... 16 Apr 29 11:34 java
5302 drwxrw-r--. 2 t... t.... 4096 Apr 29 12:59 lib
5303 drwxrwxr-x. 4 t... t.... 30 May 15 17:52 build
5304 drwxrw-r--. 2 t... t....51 May 29 09:26 conf
```

5305 10.3.3 Compilation

- The <u>Building and Deploying with Ant</u> section of the <u>SDK Developer's Guide</u> by Ping provides a detailed description of compiling and deploying the project using Apache Ant. For current deployment, it may be sufficient.
 - 1. Click on the Windows icon and begin typing the word cmd.
- 5310 2. Double-click the icon to open the Command Prompt.
 - 3. It is essential to know about the attributes that this data store will return. PingFederate calls the getAvailableFields() method to determine the available fields that could be returned from a query of this data source. These fields are displayed to the PingFederate administrator during the configuration of a data source lookup. The administrator can then select the attributes from the data source and map them to the adapter or attribute contract. PingFederate requires at least one field returned from this method.
 - 4. To change it, go to your ping installation directory. From that directory, navigate to ..\pingfederate-7.3.0\pingfederate\sdk\plugin-src\idp-query-data-store\conf. Open

5319 5320		.\config.properties with your favorite editor. Change the value for the attribute called NameOfAttributes:
5321		NameOfAttributes=fullname,username,stafflevel,role,division,employer,clearance
5322 5323		Use a comma to separate attribute names. More attributes can be added by adding subsequent commas and attribute names.
5324 5325	5.	Navigate to your PingFederate sdk folder, i.e., cd C:/pingfederate-7.3.0/pingfederate/sdk/
5326 5327	6.	Within the Command prompt window, type the following compilation command and press Enter: ant deploy-plugin

5328 10.3.4 Configuration within PingFederate Administrative Console

The end of successful execution of ant deploy-plugin signals the installation of the data-store driver. Its configuration is provided in detail by <u>Ping documentation</u>. In summary, it spans the following process:

- 5331 1. Logon to the Ping RP server.
- 5332 2. Open an internet browser.
 - Enter the following URL and press Enter: https://localhost:9999/pingfederate/app
- 4. Enter your PingFederate administrator username and password, then click **Login.**

5335

5336

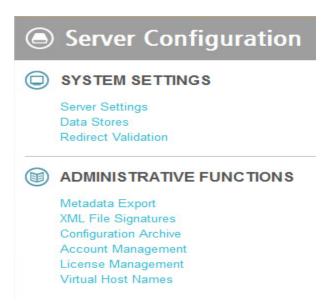

5337

5329

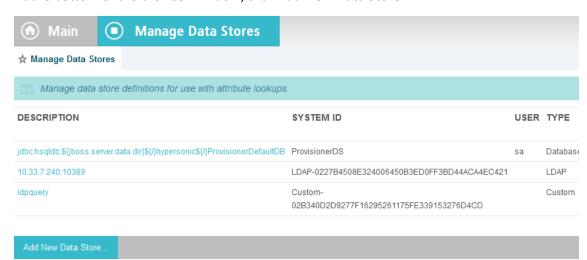

5330

5333

5. In the browser window, under the main menu area, find Server Configuration > System Settings > Data Stores. Double-click on Data Stores.

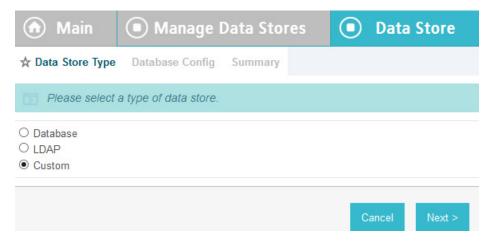

5339 6. At the bottom of the browser window, click **Add New Data Store**.

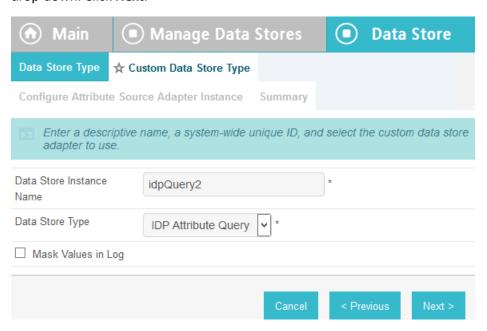

53405341

7. On the Data Store Type screen, select **Custom** and click **Next.**

8. On the Custom Data Store Type screen, specify **Data Store Instance Name** and **Data Store Type**. The name can be arbitrary, but you must select **IDP Attribute Query** from the **Data Store Type** drop-down. Click **Next**.

5346

5347

5348

5351

5352

53535354

5355

5356

5357

5358

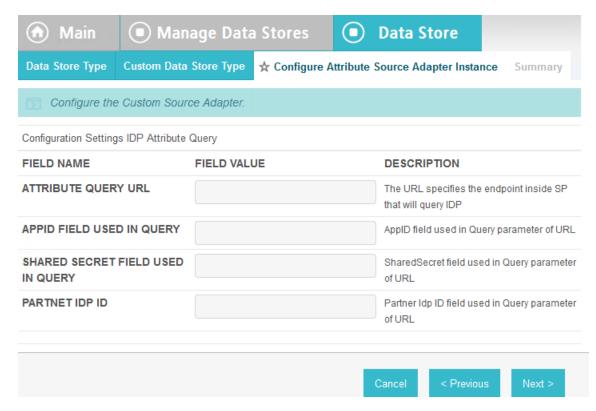

5359

5360

9. To configure the data store, the following parameters must be configured. These parameters are guided by the requirements of the end point (/sp/startAttributeQuery.ping) defined by Ping documentation here:

https://10.33.7.5:9031/sp/startAttributeQuery.ping?AppId=appid&SharedSecret=3Federate&PartnerIdpId=https://idp.abac.test:9031&Subject=Ismith@abac.test

- Attribute Query URL: the URL specifying the endpoint inside RP (Relying Party) that will
 query the IDP, i.e., https://rp.abac.test:9031/sp/startAttributeQuery.ping
- Appld field used in query: the unique identity of the initiating application, i.e., appld
- Shared Secret field used in query: used to authenticate the initiating application. The Appld and SharedSecret must both match the application authentication settings within the PingFederate server, i.e. !23234Federate
- Partner IDP ID: used to identify the specific IdP partner to which the Attribute Query should be sent. If this parameter is not present, the Subject and Issuer are used to determine the correct IdP, i.e., https://idp.abac.test:903

5362 **10.4 NextLabs PIP Plugin**

5363 10.4.1 Architecture

5361

53755376

5377

5378

- The NextLabs Control Center can support custom PIP plugin extensions for dynamic user and resource attribute retrieval during runtime. In order to install and deploy a PIP plugin such as the one described in this section, it is necessary to have previously installed and deployed the NextLabs Control Center, Policy Controller, Policy Studio, and the NextLabs Entitlement Manager (Section 7).
- According to the NextLabs PDP Policy Extension documentation, which is only available to NextLabs customers at this time, one method for leveraging this PIP extension capability is by way of a getAttribute() function within a UserAttrProviderMod class. The PIP Plugin implements methods defined by the ISubjectAttributeProvider interface. The ISubjectAttributeProvider interface declares the method getAttribute() function which enables querying for a single subject attribute sequentially until all missing required attributes have been requested.
- 5374 10.4.1.1 Required classes of the NextLabs PIP Plugin:
 - UserAttrProviderMod class must exist and must contain a getAttribute() function.
 - The getAttribute() function must accept two arguments (IDSubject and String) and return an
 EvalValue. The EvalValue is created using its build() function and the attribute value
 ultimately returned from the Protocol Broker (see Section 10.5).
- HTTPSTransmitter class
 - makes an HTTPS request to the Protocol Broker using a doPost() function

- CacheKey class, implementing a local Ehcache
 - The CacheKey class constructor takes two parameters, the subjectId and the attributeName, which serve as a compound cache key for storing and retrieving the value of a given user's attribute within the plugin's local Ehcache.

10.4.1.2 Other Required Files or Deployment Notes:

- The three above classes must be compiled into a .jar file.
 - Our method of compilation in this build was using Apache Maven 3.2.5. Maven compilations
 are directed by a pom.xml ("Project Object Model"), which is an XML representation of a
 Maven project. More information about Apache Maven and its pom file requirements can
 be found here: https://maven.apache.org/pom.html
 - According to NextLabs support, be sure to include within the pom.xml file configuration a
 statement that specifies the Provider-Class. The Provider-Class is the UserAttrProviderMod
 class that contains the getAttribute() method. Example pom.xml excerpt from the pom.xml
 file in this implementation:

- Also required per NextLabs support documentation, for any custom plugin you must include a properties file.
 - The configuration file should end with the ".properties" file extension. Example from this implementation: nlsamlpluginService.properties
 - Contents should be similar to our example copied below. You must include a *category = ADVANCED CONDITION* statement per NextLabs deployment and loading requirements:

```
name = NLSAMLPlugin_Service
jar-path = [NextLabs]/Policy
Controller/jservice/jar/nlsamlplugin/NLSAMLPlugin-0.0.1-SNAPSHOT-jar-
with-dependencies.jar
friendly_name = NLSAMLPlugin Service
description = NLSAMLPlugin Service
```

10.4.1.3 Notes on Jar and Properties File Deployment within NextLabs Policy Controller 5419 Software Architecture:

The jar file containing the three classes must be deployed on the SharePoint server within the NextLabs Policy Controller software architecture in a specific location. Under the C:/Program Files/NextLabs/Policy Controller/jservice/jar folder you must create a folder specifically for your custom jar, i.e., C:/Program Files/NextLabs/Policy Controller/jservice/jar/custom jar folder you create

- Any other required supporting jars can be compiled within the same jar as the UserAttrProviderMod class and other classes deployed as described in the previous step.
 - Otherwise, any additional required supporting jars can be compiled into a separate jar which
 is deployed elsewhere within the NextLabs Policy Controller software architecture on the
 SharePoint server, i.e., C:/Program Files/NextLabs/Policy Controller/jre/lib/ext/
 - The properties file must be deployed on the SharePoint server within the NextLabs Policy Controller software architecture in a specific location, under the *C:/Program Files/NextLabs/Policy Controller/jservice/config* folder, i.e., *C:/Program Files/NextLabs/Policy Controller/jservice/config/jarpropertiesfile.properties*

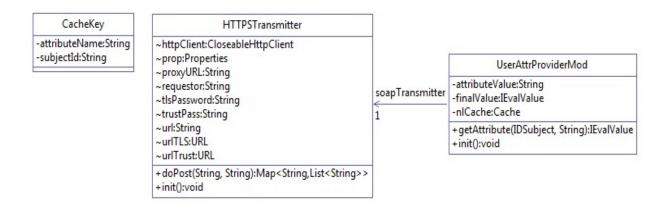

10.4.2 Understanding How the NextLabs PIP Plugin Interacts with Build Components

When a policy is executed and the NextLabs Policy Controller PDP determines that attributes sent in the initial set up of the session are insufficient, the getAttribute() function in the UserAttrProviderMod within the NextLabs Plugin jar is automatically executed sequentially for each missing attribute.

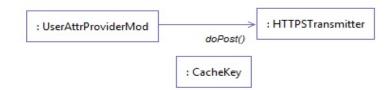

As described above, when the initial set of attributes is insufficient, the NextLabs PIP Plugin first checks a local cache, implemented using the Ehcache library and a CacheKey class illustrated above. If the requested attribute exists within the local cache, the NextLabs PIP Plugin retrieves and returns it immediately for use during policy evaluation by the Policy Controller (PDP).

If the requested attribute does not exist within the local cache, the NextLabs PIP Plugin's HTTPSTransmitter class makes an https request to the Protocol Broker using a doPost() function. The Protocol Broker performs its functions and returns either the desired attribute or an exception back to the NextLabs PIP Plugin, where the Policy Controller (PDP) can evaluate the relevant ABAC policy and determine an access decision. In the case that the requested attribute does not exist, the NextLabs Policy Controller PDP is configured to default to Deny access in our build. The NextLabs Policy Controller PDP is also configured to Deny Access whenever the Protocol Broker or the NextLabs PIP Plugin produces an exception.

Figure 10-4 NextLabs PIP Plugin Class Diagram

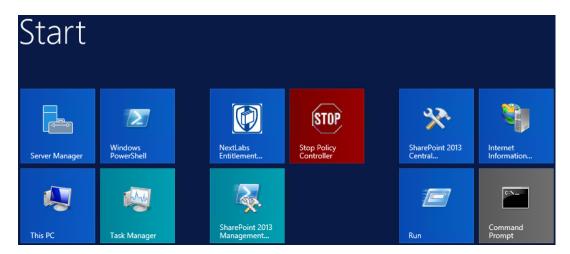

5453 Figure 10-5 NextLabs PIP Plugin Interaction Diagram

5454

- 10.4.3 Compilation and Deployment
- 5456 10.4.3.1 Compiling the NextLabs PIP Plugin Jar
- 1. Verify that you are on the server hosting your SharePoint instance, called the SharePoint server in our build.
- 5459 2. Click on the Windows icon and begin typing **Cmd.**
- 3. Double-click the icon to open the Command Prompt.
- 4. In the Command Prompt window, navigate to the folder where your pom.xml exists and click Enter, i.e., cd C:/software/java/plugin/
- 5. In the Command Prompt window, run the following command and press Enter to compile your files and jar(s) into a single jar: mvn clean install
- 5465 *10.4.3.2* Stopping the NextLabs Policy Controller Service Before NextLabs PIP Plugin Jar 5466 Deployment
- 5467 1. Still on the SharePoint server, click on the Windows icon and begin typing **Services.**
- 5468 2. Double-click the icon to open the Services application.
- 3. In the Services application window, in the list of services, click on the **Name** column to sort by alphabetical order and look for **Control Center Enforcer Service**.
- 4. If the status of the **Control Center Enforcer Service** is **running**, stop it by following these steps:
- 5472 a. Click on the Windows icon.
- 5473 b. On your main screen, double-click the **Stop Policy Controller** shortcut.

5475 c. Enter your NextLabs Administrator credentials, then click **Stop**.

5476

5477 d. Click **OK**.

5478

5482

5483

5484

5485

5486

5487

5488

5489

5479 10.4.3.3 Deploying the NextLabs PIP Plugin Jar and its Configuration File

- 1. Still on the SharePoint server, Click on the Windows icon and begin typing **Cmd.**
- 5481 2. Double-click the icon to open the Command Prompt.
 - In the Command Prompt window, navigate to the folder where your NextLabs Policy Controller installation exists, and into its /jservices/jar folder where custom plugins are required to be stored, then press Enter. i.e., cd C:/Program Files/NextLabs/Policy Controller/jservice/jar/
 - 4. In the Command Prompt window, enter a command similar to the following and press Enter to create an empty folder named after your plugin: mkdir nlsamlplugin
 - 5. In the Command Prompt window, enter a command similar to the following and press Enter to copy your plugin jar from its existing location (example *C:/software/java/plugin/target/*) to the

NIST SP 1800-3C: Attribute Based Access Control

5490 5491		new plugin folder you just created: copy "C:/software/java/plugin/target/plugin.jar" "nlsamlplugin/"
5492 5493 5494 5495	6.	In the Command Prompt window, enter a command to navigate to the folder where your NextLabs Policy Controller installation exists, and into its jservices folder which contains the config folder where custom plugin .properties files are required to be stored, then press Enter. i.e., cd C:/Program Files/NextLabs/Policy Controller/jservice/
5496 5497 5498 5499	7.	In the Command Prompt window, enter a command similar to the following and press Enter to copy your plugin .properties file from its existing location (example <i>C:/software/java/plugin/</i>) to the config folder: copy "C:/software/java/plugin/nlsamlpluginService.properties" "config/"
5500	10.4.3	3.4 Resetting IIS and Restarting the NextLabs Policy Controller Service
5501	1.	Click on the Windows icon and begin typing PowerShell.
5502	2.	Double-click the icon to open Windows PowerShell.
5503 5504	3.	In the Windows PowerShell window, type in this command and press Enter to reset Internet Information Services: iisreset
5505	4.	Click on the Windows icon and begin typing Services.
5506	5.	Double-click the icon to open the Services application.
5507 5508	6.	Within the Services application window, in the list of services, click on the Name column to sort by alphabetical order and look for Control Center Enforcer Service .
5509	7.	Right-click Control Center Enforcer Service and click Start.
5510 5511		It may be necessary to click the Refresh icon in order to see the Control Center Enforcer Service status change to running .
5512	10.5	Protocol Broker
5513 5514 5515 5516 5517 5518	noted of ShareP service	Architecture otocol Broker decouples communication between the NextLabs Plugin and PingFederate RP. As earlier, the Protocol Broker is a web application hosted on a tomcat server installed on the oint server. It communicates using mutual TLS and listens on the localhost. This ensures that the provided by Protocol Broker is not available on the network, and the requester must be ticated during each request.
5519 5520 5521 5522	read/w POST, I	roxy extends the HttpServlet class, which is an abstract class. This enables SAMLProxy class to write the http request/response, and determines the http://method of the request (i.e. HTTP GET, DELETE, HEAD etc) and calls one of the corresponding methods. The SAMLProxy class only ments the POST method.
5523 5524		MLProxy class constructs an object of the SoapHTTPTransmitter class. This class reads

5525 5526 5527	SoapHTTPTransmitter with PingFederate. It also reads abacSigningClient.jks , which is used to sign the SAML AttributeQuery, and metadata to verify the SAML Response signature. The jks extension stands for Java Key store, which is a storage facility for cryptographic keys and certificates.		
5528 5529	The Protocol Broker facilitates secure communication between the NextLabs PIP Plugin and PingFederate RP. This coordination consists of two parts:		
5530	1. Communication between the NextLabs PIP Plugin and the Protocol Broker		
5531	2. Communication between the Protocol Broker and the PingFederate RP server		
5532	10.5.1.1 Communication Between NextLabs PIP Plugin and Protocol Broker		
5533	The Protocol Broker's doPost() method expects the following parameters:		
5534	Requester		
5535	SubjectId		
5536	 AttributeName 		
5537 5538 5539 5540	On successful receipt of a request, SAMLProxy uses the SoapHTTPTransmitter class to transmit the request to the PingFederate RP server. The response received from SOAPHTTPTransmitter is dispatched back to the NextLabs PIP Plugin, which then hands the result off to the PDP for policy evaluation and access decision making.		
5541	10.5.1.2 Communication Between Protocol Broker and PingFederate RP Server		
5542 5543 5544 5545 5546 5547	The PingFederateRP and ProtocolBroker communicate using Assertion Query/Request Profile. As shown in Figure 10-6, Protocol Broker initiates the secured communication on a mutual TLS channel with the Relying Party, and sends a signed SAML2 AttributeQuery. The message format and structure of the AttributeQuery is defined by SAMLCore Section 3.3.2.3. Binding for the profile is defined by SAMLBind Section 3.2.3. Processing rules governing the profile are provided by Section 3.3 of SAMLCore. In response, Protocol Broker expects a SAML response back.		
5548	OpenSAML is used to implement an Assertion Query/Request Profile. OpenSAML is a set of open source		
5549	libraries meant to support developers working with Security Assertion Markup Language (SAML). The		
5550	configuration required to use the OpenSAML library is provided in Section 10.5.2.2.		

Figure 10-6 Communication Between Plugin and Relying Party

Based on keystores and configuration read during initialization, SoapHTTPTransmitter creates a SAML2AttributeQuerBuilder class to build a Signed SAML 2.0 Attribute Query. Attribute names received earlier in the doPost() method are used to build the AttributeQuery. A SOAPSAML2 object is used to provide SOAP parameters for the SAML message created earlier. It reads SAML 2.0 metadata to find the location of the Attribute Authority end point. It uses HttpSOAPClient to dispatch the request to the end point using mutual TLS.

HTTPSoapClient is also responsible for receiving the Attribute response, verifying the signature and sending the attributes back to the Nextlab Plugin.

Figure 10-7 Protocol Broker Interaction Diagram

5572

10.5.2 Deployment

10.5.2.1 System and Environment Requirements

The Protocol Broker is deployed on tomcat 8.0.22 on the SharePoint server, and uses OpenSAML 2.6.4.

10.5.2.2 Configuration

- In order to accept traffic only on the channel protected by mutual TLS:
 - 1. Install tomcat on the SharePoint server. The tomcat installation procedure is provided here.
 - 2. Open the configuration file **server.xml** inside the configuration directory of the tomcat installation. Comment out the section:

,,,

```
5578
           3. Update/insert the following line:
5579
               <Connector port="8443" protocol="org.apache.coyote.http11.Http11NioProtocol"</pre>
5580
              maxThreads="150" SSLEnabled="true" scheme="https" secure="true"
5581
              keystoreFile="C:\Users\<name>\Documents\softwares\tomcat\apache-tomcat-
5582
              8.0.22\conf\abacTomcat.jks" keystorePass="....password" clientAuth="true"
5583
              sslProtocol="TLS"
5584
              truststoreFile="C:\Users\sjha\Documents\softwares\tomcat\apache-tomcat-
5585
               8.0.22\conf\truststore.jks" truststoreType="JKS" truststorePass="...password" />
5586
       The configuration details for OpenSAML are provided here. In this demonstration, a folder called
       endorsed is created inside the lib directory of tomcat installation.
5587
       Add the following libraries to the endorsed folder created in the above step:
5588
5589
              xml-apis-2.10.0.jar
5590
              xml-resolver-1.2.jar
5591
              xercesImpl-2.10.0.jar
5592
              xalan-2.7.1.jar

5594
       10.5.2.3 Preparation and Compilation
5595
       In our build, we used Apache Mayen for Protocol Broker compilation. In order to prepare and compile
       the Protocol Broker, follow these steps:
5596
       10.5.2.3.1 Preparation
5597
5598
           1. On the SharePoint server, click on the Windows icon and begin typing Cmd.
5599
           2. Double-click the icon to open the Command Prompt.
5600
           3. In the Command Prompt window, navigate to the folder where your pom.xml for the Protocol
               Broker exists, and press Enter. i.e., cd C:/software/java/samlNewPlugin/
5601
5602
           4. Type the following command, then press Enter to prepare for compilation of the new Protocol
               Broker: .war file: mvn clean
5603
5604
           5. Verify that your results are similar to the following, including the Build Success statement:
5605

5779 10.6 Apache Directory Service (ApacheDS)

- 5780 ApacheDS is included in <u>Apache Directory Studio</u>, which has multiple functionalities with ApacheDS 5781 Server, i.e., LDAP Browser, Schema Editor, Apache Configurator, LDIF Editor, Embedded ApacheDS, and 5782 ACI Editor.
- 5783 10.6.1 Layout

5786

57875788

5789

5790 5791

5792

- Before installation, it is important to consider system needs and match them with the installation layout.

 The general layout for ApacheDS consists of two major concepts:
 - 1. Installation Layout: The installation is where all files essential to ApacheDS are stored, i.e., launch script, libraries, and a service wrapper (depending on the kind of installer used).
 - 2. Instance Layout: ApacheDS is built to run multiple instances of the server at the same time, which means that an optional instances folder can be found in the installation layout (or elsewhere on the disk, depending on the platform). In that folder you will find one or multiple directories, all sharing the same layout, corresponding to all ApacheDS instances (one directory per instance, with names corresponding to the ID of the instance).
- A detailed discussion of these concepts can be found <u>here</u>.
- 5794 10.6.2 Download
- ApacheDS can be downloaded as binary or as source, and compiled on a given platform. Source can be downloaded here.
- In this project, ApacheDS was downloaded as a packaged Windows installer from this <u>location</u>. Native installers are available in the following formats, and their download links are available at following <u>site</u>.

Platform	Installer Format
Window	Exe
Mac OS X	Dmg
Debian	Deb
Linux	Rpm,bin

5803 5804

5805

5806

5807

5808

5809

5810

1. At the download <u>location</u>, you will see a URL as shown in the example below. Click the link above to download Apache Directory Server for Windows.

Figure 10-9 ApacheDS Download

2. During the software download, different installation graphics will be displayed depending on which browser you use. Example from Windows Internet Explorer:

15% of apacheds-2.0.0-M20.exe downloaded 1 min 22 sec remaining Pause Cancel View downloads X

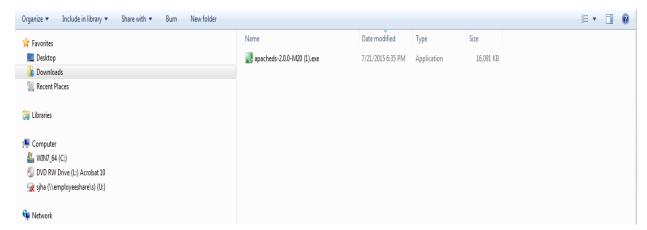

On Chrome, it may display as below (if you are not using command line tools):

apacheds-2.00-M20...exe
Show all downloads... ×

10.6.2.1 Verify the Integrity of the Downloaded File

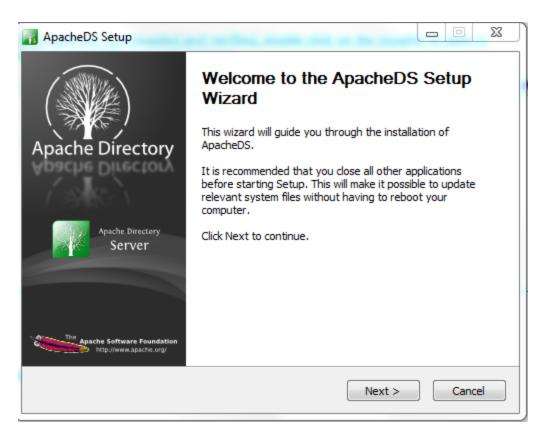

- It is essential to verify the integrity of the file when the download completes.
- The file's integrity can be verified with PGP signatures using PGP or GPG. First, download the <u>KEYS</u> and
- 5812 the asc signature file for the relevant distribution. Both KEYS and asc can be found to the right of the
- 5813 download link, as shown in Figure 10-9 above.
- 5814 Verify the signatures using the following commands in the Command Prompt:
- 5815 \$ pgpk -a KEYS
- \$ pgpv apacheds-2.0.0-M20.exe.asc
- 5817 or
- 5818 \$ pgp -ka KEYS
- \$ pgp apacheds-2.0.0-M20.exe.asc
- 5820 or

- \$ gpg --import KEYS
- \$ gpg --verify apacheds-2.0.0-M20.exe.asc
- Alternatively, you can verify the MD5 signature on the files. A Unix program called *md5* or *md5sum* is included in many Unix distributions. It is also available as part of GNU Textutils. Windows users can get
- 5825 binary md5 programs from here, here, or here.
- 5826 10.6.3 Installation
- 5827 <u>Note</u>: To install ApacheDS as a Windows service, you need administrative privileges. We installed
- 5828 ApacheDS on Windows Server 2012. The ApacheDS installation procedure for other operating systems
- 5829 can be found here.
- 5830 1. Once ApacheDS is downloaded and verified, double-click the installer to open it. Note: It may have already been opened by your web browser.

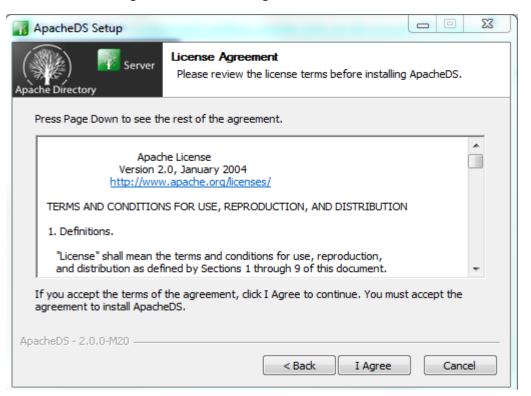

5832

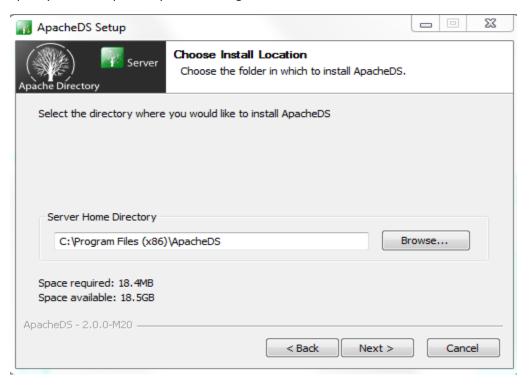

5833 2. When the following screen appears, click **Next**.

3. Review the License agreement and click I Agree.

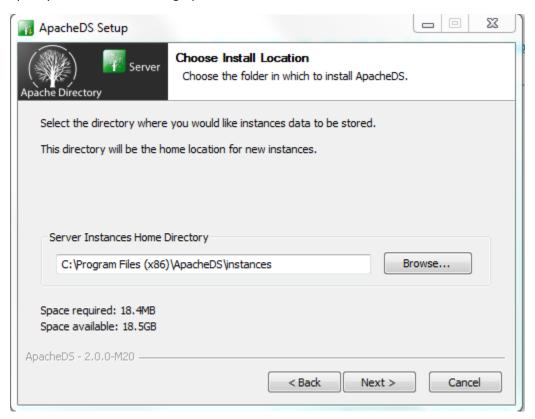

5837 4. The next screen prompts you for the install path. In our build, we left the default install path. Specify an install path of your choosing, and click **Next**.

5839

5. Specify a location for storing ApacheDS instances, then click **Next**.

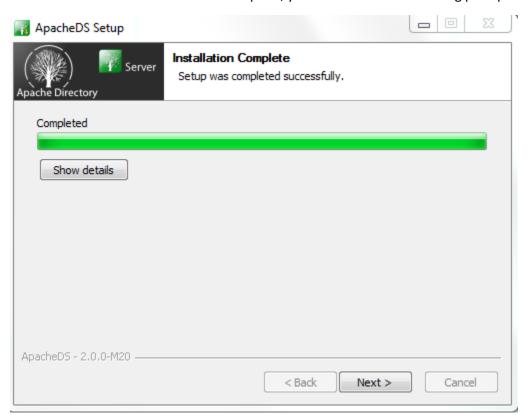

5842 6. The next screen asks for the location of your java run time. It is assumed, based on the earlier description in Section 10.8.2, that users will have the proper java environment prior to attempting to install ApacheDS. Users who have no JRE installed should abandon the install by clicking Cancel. Install the JRE and re-run the ApacheDS install. We accepted the default as shown.

5847

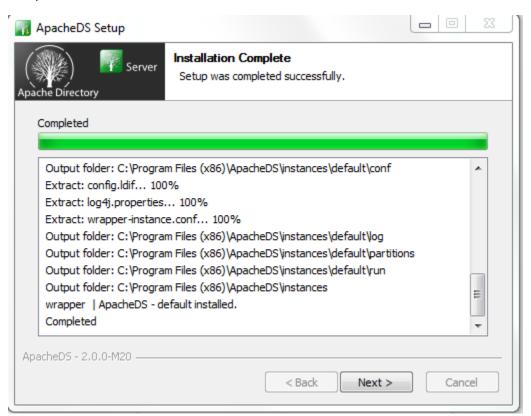

5848

7. Click **Install**. Once the installation is complete, you will receive the following prompt:

10.6.3.1 Functional Test of the ApacheDS Installation

1. Click **Show Details** in above diagram to see details of installation. Make sure all of the folders exist, then click **Next**.

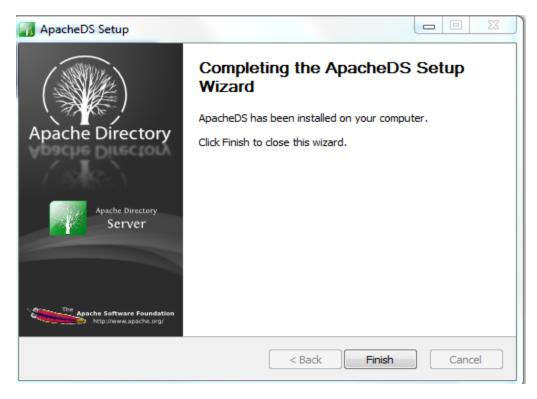

5853

5854

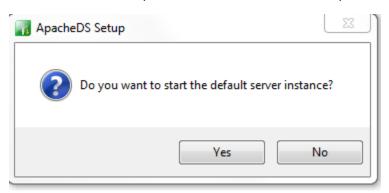

5850

5851 5852

2. Click **Finish** to end the installation.

3. Click **Yes** to start the ApacheDS server. Instructions are provided in <u>Section 10.6.2</u>.

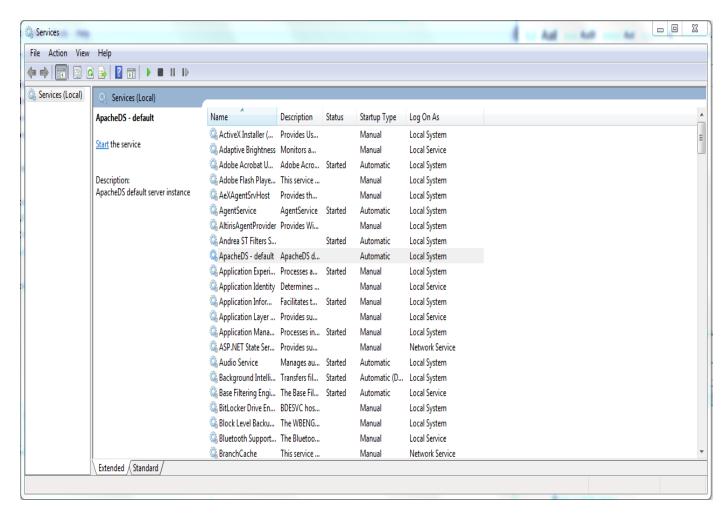

5857

5858

10.6.4 Starting and Stopping the Server

The server can be started and stopped with the Windows Services manager (Control Panel >
 Administrative Tools > Services). The user must have administrative privileges.

- 5862 From here, ApacheDS can be started, stopped, or restarted.
- The process for starting and stopping ApacheDS on other operating systems is described here.
- 5864 10.6.5 ApacheDS Configuration
- 5865 ApachdDS Server and Schema configuration details are provided <u>here</u>.
- 5866 10.7 PingFederate Apache Integration
- This section requires knowledge of the following pieces of information:
- 5868 Server IP address or hostname
- Server port where it is listening on
- 5870 Server credentials (i.e., private key and certificate) to be provisioned on directory server
- 5871 10.7.1 Provisioning of Server Credential
- 5872 Start Apache Directory Server Studio and open a new connection.

5877

5878

5879

10.7.1.1 Creation of Server Connection To create a new LDAPS connection, complete the following steps: a. Define network parameters. b. Define authentication parameters.

- d. Define additional edit options (optional).
 - Android Studio

 Apache Directory Studio

 Apache Directory Studio

 Cumentation

 Uninstall

 ApacheDS

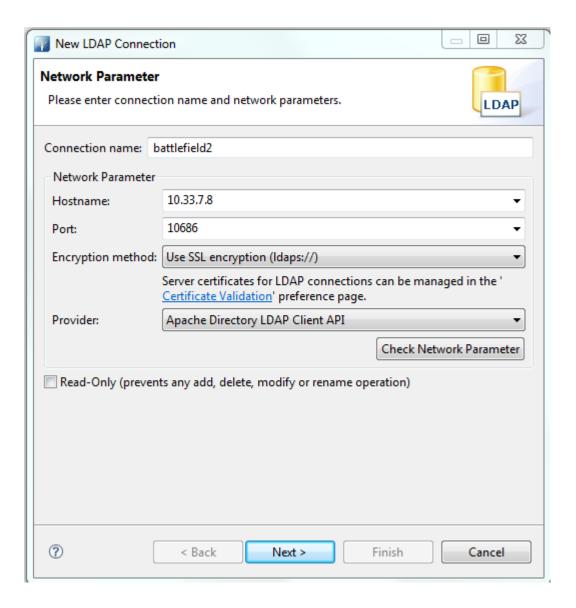

c. Define additional browser options (optional).

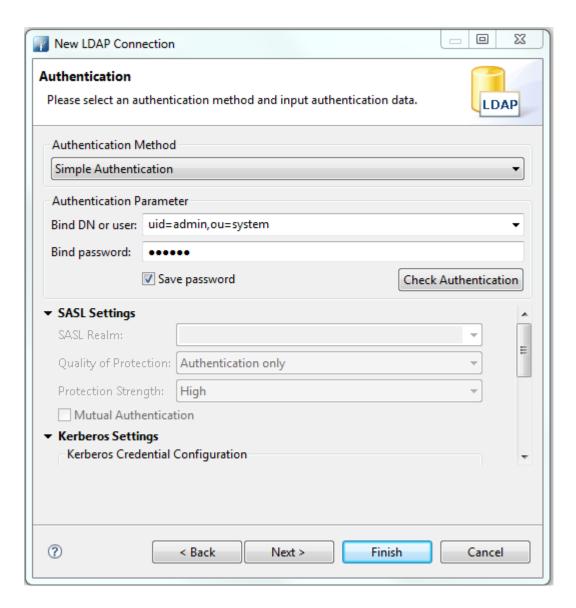

5881

5882

2. Once a new connection is opened, the following screen appears. Fill in **Hostname** and **Port**. Select the encryption method **Use SSL encryption(ldaps://)**, then click **Next**.

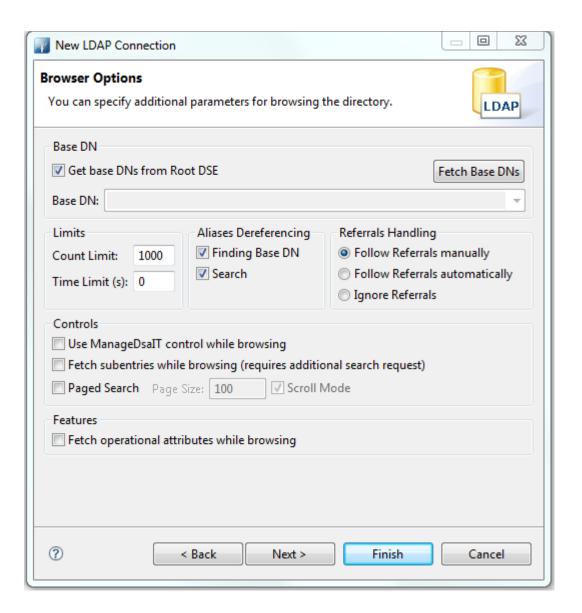

Option	Description	Default
Connection name	The name of the connection. In the Connections view, the connection is listed with this name. The name must be unique.	empty
Hostname	The hostname or IP address of the LDAP server. A history of recently used hostnames is available through the drop-down list.	
Port	The port of the LDAP server. The default port for non-encyrpted connections is 389. The default port for Idaps:// connections is 636. A history of recently used ports is available through the drop-down list.	
Encryption method	The encryption to use. Possible values are: No encryption, ldaps:// and StartTLS extension.	No encryp- tion
Provider	Option to choose either JNDI or Apache Directory LDAP client API	
Check net- work parame- ter	Use this function if you want validate that the entered information is correct, and the server is reachable.	
Read-Only	If this option is chosen, any attempts to modify will return an error.	

Option	Description	Default
Authentication Method	 Select your authentication method: Anonymous Authentication: connects to the directory without authentication. Simple Authentication: uses simple authentication using a bind DN and password. The credentials are transmitted in clear-text over the network. CRAM-MD5 (SASL): authenticates to the directory using a challenge-response authentication mechanism. The credentials are not transmitted in clear-text over the network. DIGEST-MD5 (SASL): another challenge-response authentication mechanism. Additionally, you could define your realm and QoP parameters. GSSAPI (Kerberos): user Kerberos-based authentication. Additional parameters can be defined. 	Simple Au- thentication
Bind DN or user	The distinguished name or user ID used to bind. Previously entered DNs can be selected from drop-down list.	empty
Bind Password	The password used to bind.	empty
Save password	If checked, the password will be saved in configuration. If not checked, you must enter the password whenever you connect to the server. Warning: The password is saved as plain text.	checked
Check Authentication	Use this function to attempt a connection plus a bind to the host upon completion of the wizard. It will validate that the entered information is correct.	

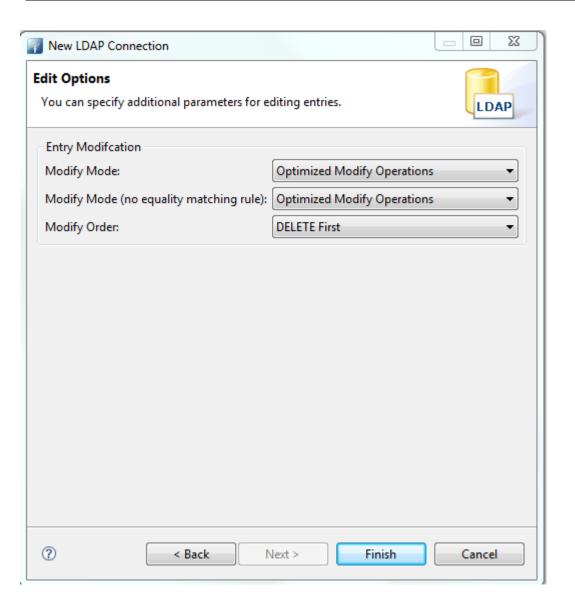

This project does not use SASL or Kerberos.

Option	Description	Default
Get base DNs from Root DSE	If checked, the base DNs are fetched from the namingContexts attribute of the Root DSE.	
Fetch Base DNs	Use this function to get the namingContext values from the Root DSE. The returned values will appear in the Base DN drop-down list.	-
Base DN	The Base DN to use. You may enter a DN manually or select one from the drop-down list. This field is only enabled if the option Get base DNs from root DSE is off.	empty
Count Limit	Maximum number of entries returned from the server when browsing the directory. It is also used as default value when searching the	1000

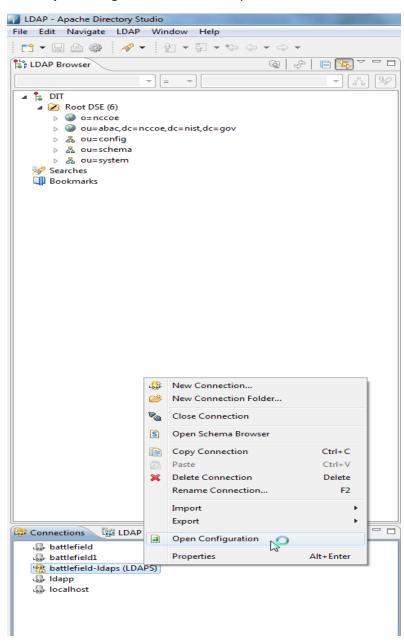

Option	Description	Default
	directory. A value of 0 means no count limit. Note that this value is a client-side value. It is also possible to use a server-side limit.	
Time Limit	The maximum time in seconds the server searches for results. This is used as default value when browsing or searching the directory. A value of 0 means no limit. Note that this value is a client-side value. It is also possible to use a server-side limit.	0
Alias Deref- erencing	Specifies whether aliases should be dereferenced while finding the search base entry, when performing the search, or both. To manage (create, modify, delete) alias objects you must uncheck both options.	Both find- ing and searching
Referrals Handling	 Follow Referrals Manually: Received referrals and search continuations are displayed in the browser. When you open or expand a search continuation, the search is continued. Specify which connection you want to use to follow a specific referral URL. You will have full control regarding encryption and authentication options when following referrals. Follow Referrals Automatically: Follows referrals and search continuations immediately if they are received from the directory server. Specify which connection you want to use to follow a specific referral URL. You will have full control regarding encryption and authentication options when following referrals. Ignore Referrals: Any referral or search continuation received from the directory server is silently ignored. No error is logged, no dialog appears, no special entry is displayed in the DIT, and no ManageDsalT control is sent to the server. 	Follow Re- ferrals manually
Use Man- ageDsaIT control while browsing	If enabled, the ManageDsaIT control is sent to the server in each request. This signals the directory server not to send referrals and search continuations, but return the special referral objects. Note: This is only applicable if the directory server supports the ManageDsaIT control.	unchecked
Fetch suben- tries while browsing	If enabled, both normal and subentries according to RFC 3672 are fetched. This causes additional search requests while browsing the directory.	unchecked
Paged Search	If enabled, the simple paged result control is used while browsing the directory. With page size you can define how many entries should be retrieved in one request. If Scroll Mode is enabled, only one page is fetched from the server at a time. While browsing, you can scroll through the pages by using next page and top page . If	unchecked

Option	Description	Default
	disabled, all entries are fetched from the server. The paged result control is only used in the background to avoid server-side limits.	
Fetch opera- tional attrib- utes while browsing	If enabled, both user attributes and operational attributes are retrieved while browsing. If the server supports the feature All Operational Attributes , use + to retrieve operational attributes. Otherwise, all operational attributes defined in the schema are requested.	unchecked

Option	Description	Default
Modify Mode	 Specify the modify mode for attributes with an equality matching rule. Options: Optimized Modify Operations: uses add/delete by default, uses replace if operation count is less Always REPLACE: always uses replace operations to perform entry modifications Always ADD/DELETE: always uses add and/or delete operations to perform entry modifications 	Optimized Modify Opera- tions
Modify Mode (no equality matching rule)	 Specify the modify mode for attributes with no equality matching rule. Options: Optimized Modify Operations: uses add/delete by default, uses replace if operation count is less Always REPLACE: always uses replace operations to perform entry modifications Always ADD/DELETE: always uses add and/or delete operations to perform entry modifications Recommended values for various LDAP servers: ApacheDS: Optimized Modify Operations or REPLACE OpenLDAP: REPLACE OpenDS / SunDSEE: Optimized Modify Operations (missing equality matching rules for many standard attribute types) Active Directory: Optimized Modify Operations (exposes no equality matching rules at all) eDirectory: Optimized Modify Operations (exposes no equality matching rules at all) 	Optimized Modify Opera- tions
Modify Order	Specify the modify order when using add and delete operations.	Delete first

3. Go to **Open Configuration** for the newly created connection.

Property	Default Value	Description
keystoreFile	none	Path of the X509 (or JKS) certificate file for LDAPS
certificatePassword	changeit	Password used to load the LDAPS certificate file
port	10636	LDAPS TCP/IP port number to listen to
enableSSL	true	Sets if SSL is enabled or not

- 4. Make sure **Enable LDAPS Server** is checked, and **Port** is the same as provided during creation of the connection.
- 5. Go to SSL/Start TLS Keystore.
- 5897 6. Provide the **location** of the Keystore file and the **password** for the certificate.
- 5898 7. **Save** the configuration.
- 5899 8. **Restart** the server.

5900

5926

5927

10.7.1.2 Verification

```
5901
       OpenSSL was used to acquire the server public certificate.

10.7.1.3.1 Creation of Data Store to Connect to ApacheDS

SYSTEM SETTINGS

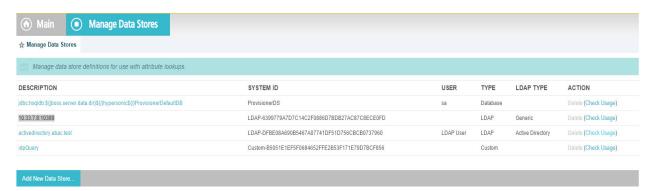

Server Settings Data Stores Redirect Validation

ADMINISTRATIVE FUNCTIONS

Metadata Export XML File Signatures Configuration Archive Account Management License Management Virtual Host Names

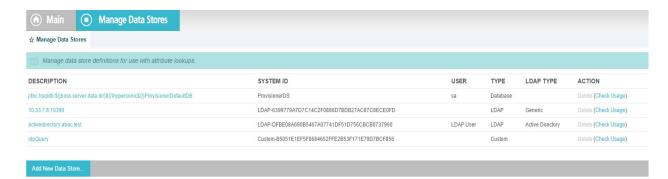

5943 5944

7. Click on Data Stores.

5945 5946

8. In the Manage Data Stores window, click Add New Data Store.

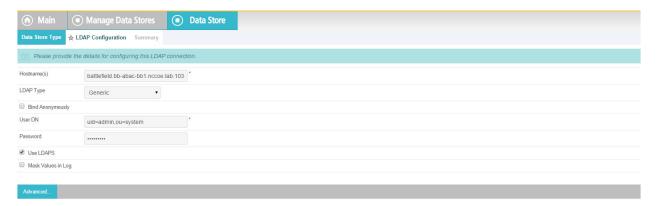

5947

5948 9. **Choose LDAP,** and click **Next.**

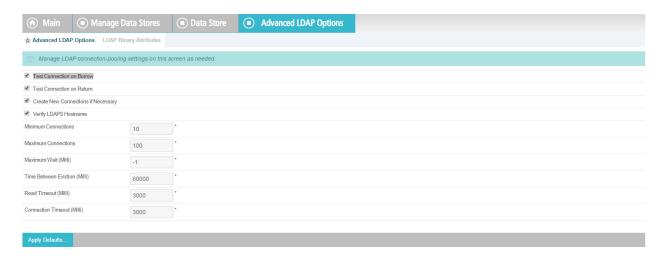

5949

5950 10. **Provide** a **Hostname** and **Ldaptype**.

59515952

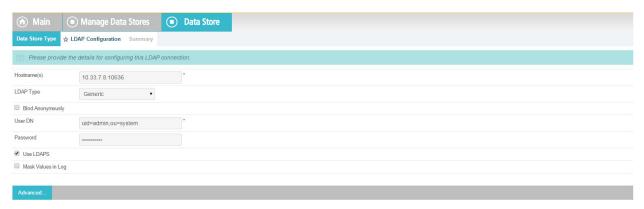

5953 5954 11. It may be necessary to configure connection pooling. It is important to select Verify LDAPS Hostname if the directory server certificate is bound to a hostname, and this hostname can be verified.

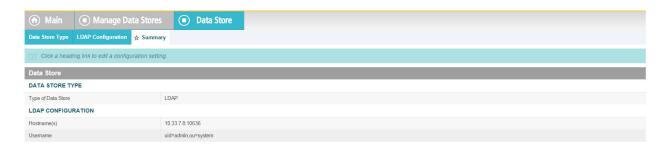

12. If there is any binary data, enter it in the **Binary Attribute Name** Field, and click **Add**.

13. A **summary** of the LDAP configuration will appear.

14. A **Summary** of the **connection** will appear as following. Click **Save**. You will then return to the Main Admin console.

5963	10.8 Configuration of PingFederate to Query the JIT Cache when
5964	Responding to Secondary Attribute Requests
5965	10.8.1 Introduction
5966	This section will cover all the configuration steps required to enable PingFederate RP to communicate
5967	with the Secondary attribute Provider and respond to its queries. The SP connection section will cover
5968	communication channel protection and message protection. To fulfill the query request from the
5969	NextLabs PIP Plugin and Protocol Broker, PingFederate queries its local LDAP server called Just in Time
5970	(JIT) cache. Note that PingFederate RP may not have data to fulfill the query. In that case, PingFederate
5971	RP extends the query to PingFederate IdP using a unique method (Ping Data source).
5972	A Data Store is any type of source for digitized data, i.e., database, file, stream, etc. PingFederate
5973	administration console uses this term for system settings. In the Java software platform, <u>data source</u> is a
5974	factory for connections to the physical data source that this data source object represents. Thus, data
5975	source is the logical manifestation of a physical data store in a java application. Due to this, the terms
5976	will be used interchangeably below.
5977	This section provides the configuration needed to query JIT cache, i.e., creation of the data source for
5978	the LDAP Server. We have already discussed the configuration of Ping Data Source in Custom Data Store
5979	section. SP connection describes how both of these data stores are chained together to fetch the result
5980	of the attribute query.
5981	10.8.2 Prerequisites
5982	Before starting this configuration, the following steps must have already been completed:
5983	1. Sections 2-7
5984	a. Complete Installation of PingFederate, both RP and Idp
5985	2. Installation and configuration of ApacheDS
5986	3. Installation of Ping Custom Data Store
5987	4. Availability of Ping web administration console (automatically included in the PingFederate
5988	installation from previous How-To Guide sections)
5989	10.8.2.1 SP Connection
5990	As described above, PingFederate (RP) acts as an IdP for the Secondary attribute provider. In order to
5991	enable support for exchange of federation-protocol messages and provide channel protection, it is
5992	essential to configure the SP (Service Provider) connection. Note: Ping Identity's documentation uses the
5993	term Service Provider and SP where the rest of our ABAC documentation uses the term Relying Party
5994	and RP. In this document, please consider these terms interchangeable.
5995	The following goals are achieved by configuration of the SP connection:
5996	 Specification of connection and associated security protocol (i.e., TLS/SSL)
5997 5998	 Specification of SAML profile t including detailed security specifications (the use of digital signatures, signature verification, XML encryption)

- 5999 Specification of Attributes that may be sent using the SAML2 Attribute Query profile
 - Specification of Data Store(s), if agreement between Idp and SP includes sending a SAML response containing attribute values from a local data store
- 6002 10.8.2.1.1 Specification of Profile
 - Instructions on how to create a new connection can be found here.
- 1. Click on Manage on All SP in the first column on the left hand side.

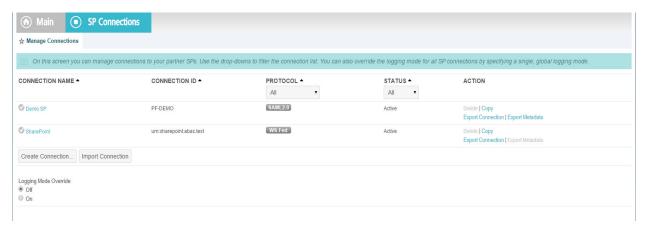

6005 6006

6000

6001

6003

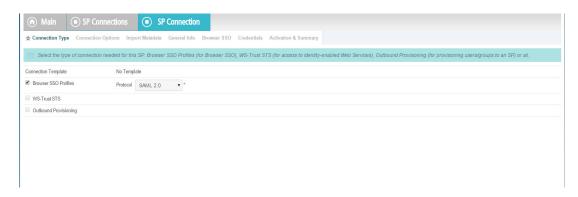

2. The following screen will appear. Click on **Create Connection**.

6007 6008

6009

3. Check the box for **Browser SSO Profiles** and select **SAML 2.0** as protocol from the drop-down menu.

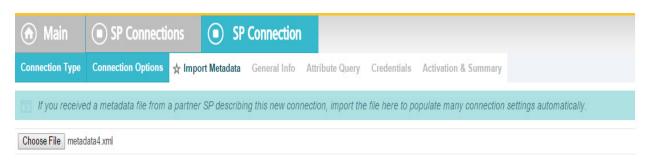

6010

4. Uncheck **Browser SSO**, check **Attribute Query**, and click **Next**.

6012

6013 5. Choose a metadata file and click **Next**.

6014

6015

6016

6017

6018

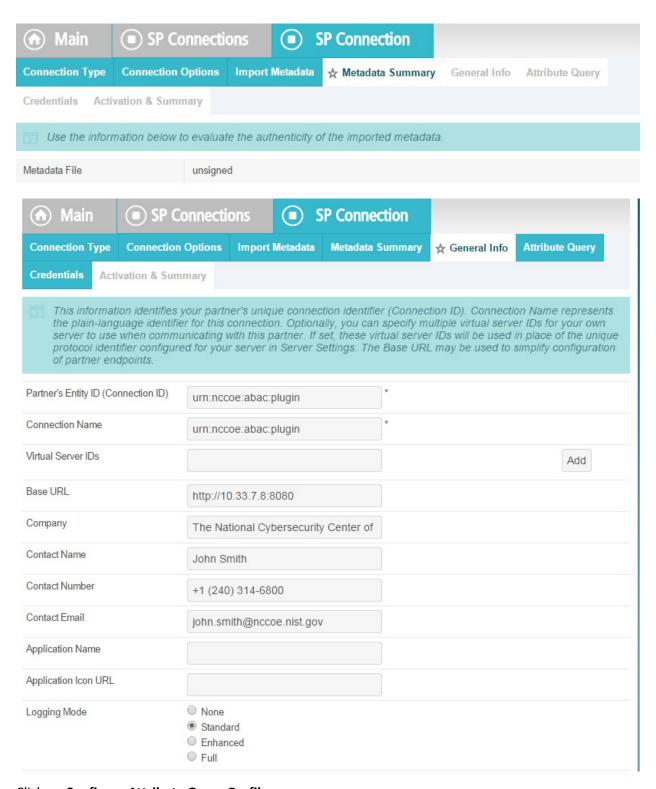

6019

6. SAML2 metadata has its own <u>specification</u>. As per this specification, KeyDescriptor is an optional sequence of elements that provides information about the cryptographic keys that the entity uses when acting in this role. However, for message authentication and integrity, it is essential to provide the certificate so that signed messages coming from the secondary attribute provider can be verified. A relevant part of metadata is shown here:

```
6020

U3r4Pv6s

7. Verify the metadata content.

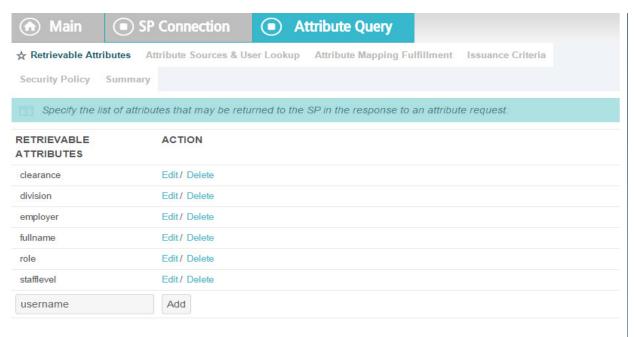

6056

8. Click on Configure Attribute Query Profile.

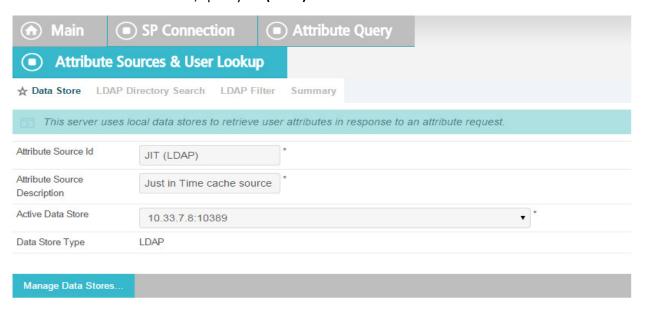

9. Specify the list of attributes that may be returned to the SP in response to an attribute request.

6062 10.8.2.1.2 Specify a series of data stores.

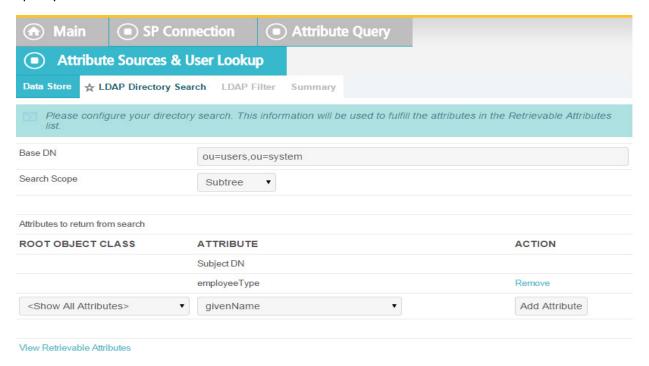

1. In the Attribute Source Id field, specify JIT (LDAP).

6064 6065

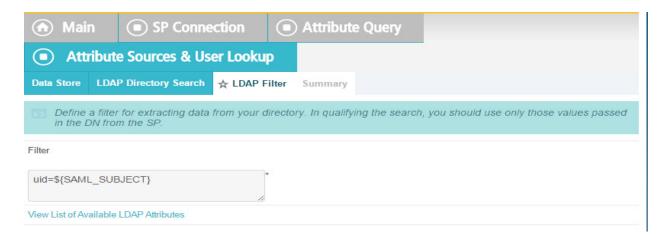

6063

2. Specify **Attributes** for the JIT Cache.

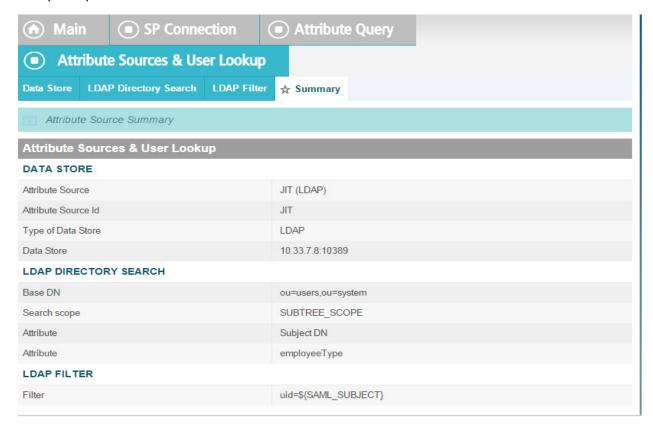

6066 6067

3. Specify LDAP Filter.

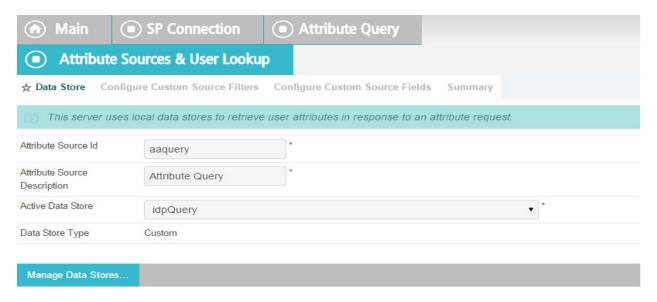

6069

4. Verify that your data is correct.

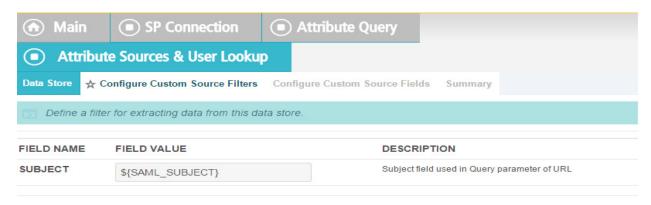

6070 6071

5. Specify a custom **Data Store**.

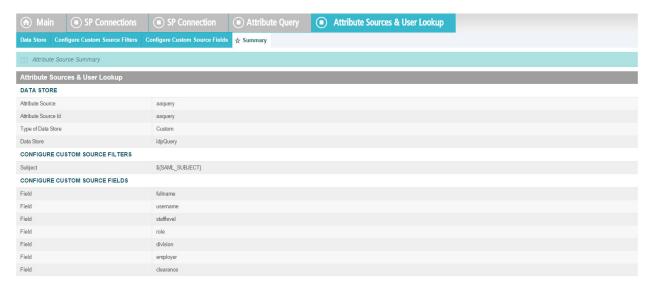

6. Define a filter for extracting data from this data store.

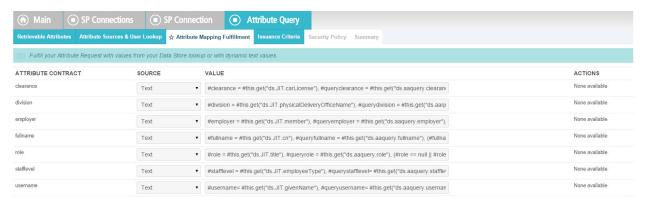

7. Based on the data elements available from this data store, select the ones pertinent to this connection. Note that these are the attributes you previously selected to return from Ping Custom Data.

Click Retrieve.

6081 9. Click on Attribute Mapping Fulfillment.

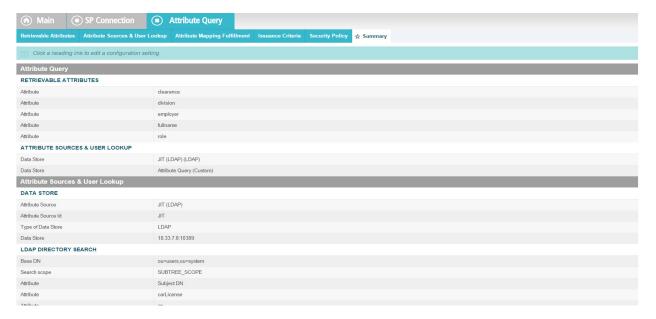

10. **Issuance Criteria**: PingFederate can evaluate various criteria to determine whether to issue an attribute query response. Use this optional screen to configure the criteria for use with this conditional authorization.

11. Click on Security Policy.

6089 12. Check the **Summary**.

6090 6091

13. Provide **Credentials** for the back channel attribute request.

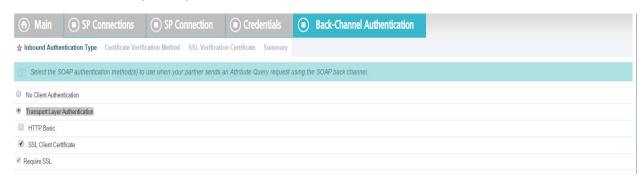

6092 6093

14. Specify Inbound Back-Channel Authentication and Digital Signature on the message.

6095 10.8.2.1.3 Back Channel Authentication Configuration

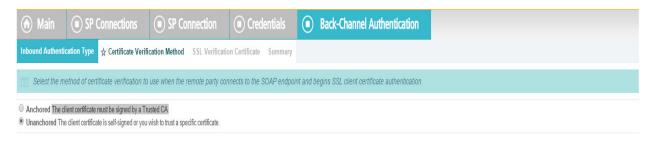

1. Use the default Transport Layer Authentication with SSL Client Certificate.

6097 6098

6096

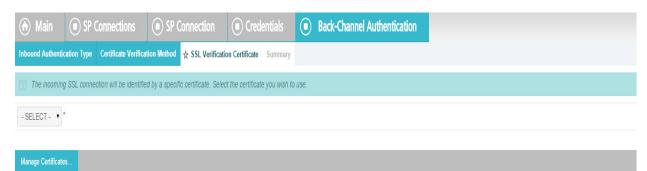

2. It is encouraged to use the **Anchored** verification method.

6099 6100

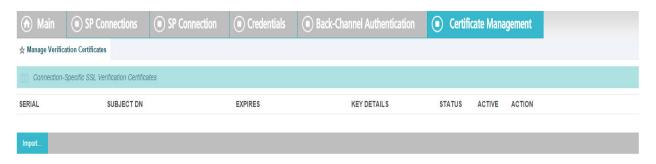

6101

3. You will be prompted to select an **SSL Verification Certificate**. In our build, a certificate has not been previously imported. Click on **Manage Certificate**.

6102 6103

4. Click Import.

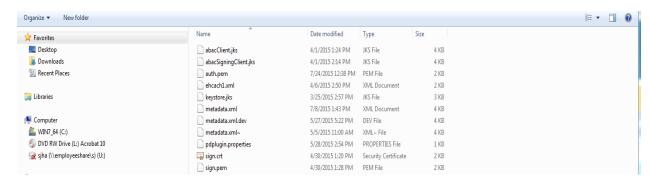

6104 6105

Click Choose File.

6106 6107

Select your certificate file from the Explorer window.

6108 6109

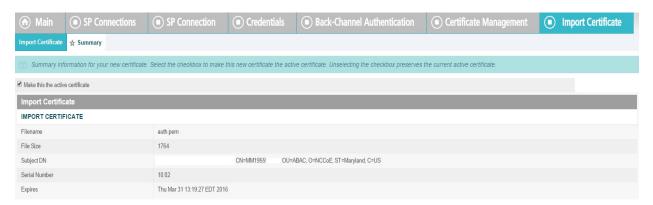

7. The file name will appear in the **Filename** field.

6110

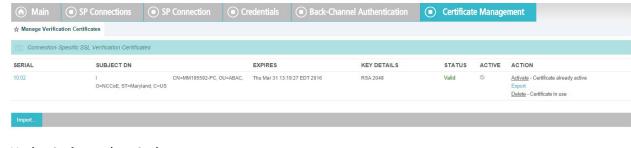

6111

- 8. Click **Next**. This will display details of parts of certificate.
- 9. Check **Make this the active certificate** and click **Done**.

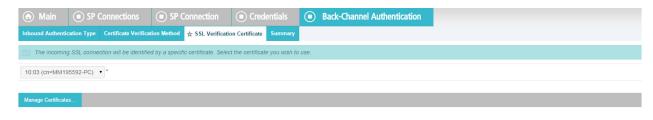

6113

6114 10. Verify the certificate.

6116 11. Under Action, select Activate.

6117

6115

6118 12. View a **Summary** of the verification.

13. Return to the **Back Channel Authentication** tab.

61216122

6119

14. Select **Digital Signature Settings** for outgoing messages, then click **Next**.

6123

15. Go to **Digital Signature settings**. Click **Configure**.

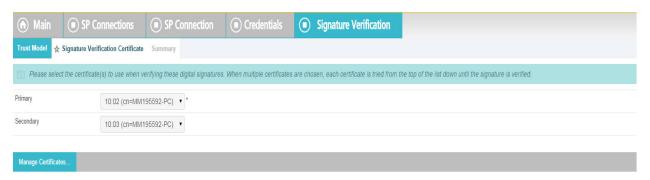

16. Select **Digital Signature Settings** on incoming messages.

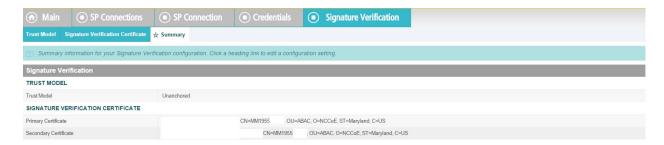

17. Click on Manage Signature Verification Settings.

18. Select the certificate(s) to use when verifying these digital signatures. When multiple certificates are chosen, each certificate is tried from the top of the list down until the signature is verified. It is assumed that signed certificates have already been imported. If not, click on **Manage**Certificate and complete the steps detailed earlier for importing a certificate.

19. Verify the **Summary**.

6136

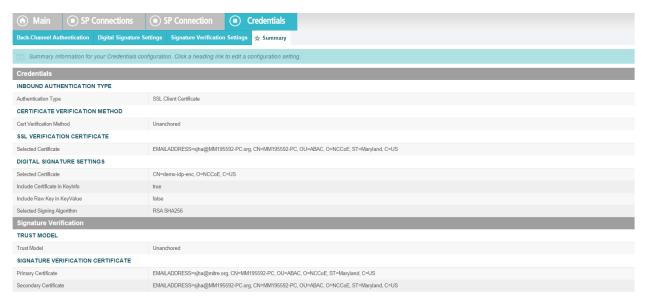

6137

20. This completes the signature verification credential settings.

6138

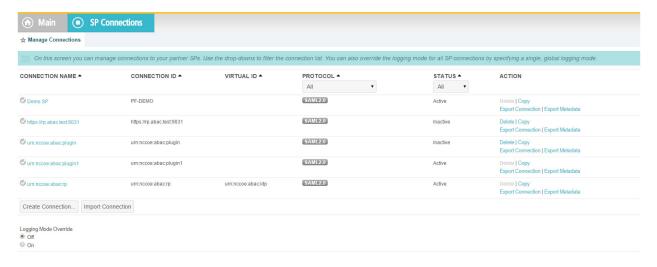

6139 21. Verify the **Summary**.

6140

6141 22. **Activate** the connection and **Save**.

6143 23. **Save** again.

6144

6146

6147

6148

6149

6145 *10.8.2.2 IDP Connection*

As an SP, you are making a connection to a partner IdP. Follow these steps to select the type of connection needed for this IdP:

1. On the righthand side of the administrative console, click **Manage All IdP** under **IdP Connections.**

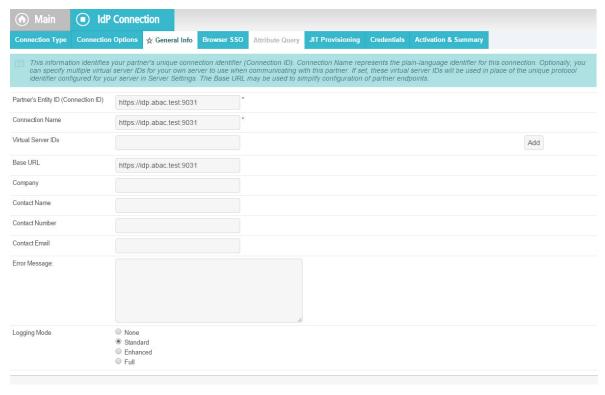

6152

2. Open the connection that was created in <u>Section 6</u>. Click on **Connection Option**. It my default to **Browser SSO**. Additionally, select **Attribute Query** and **JIT Provisioning**.

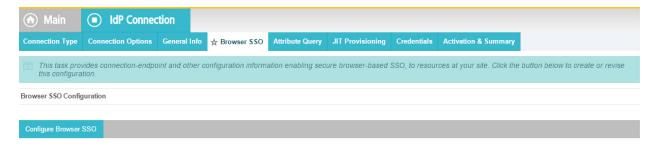

6153 6154

3. Click **Next**. Verify that the information in the **General Info** tab is correct.

6156 4. Click **Next**.

6157 6158

6155

5. Click on Configure Attribute Query Profile.

6. Specify an Attribute Authority Service URL.

6161

6159

7. Attributes requested by your application may not match exactly the attributes supplied by the IdP. Specify the mapping between these sets of attributes.

6164 6165

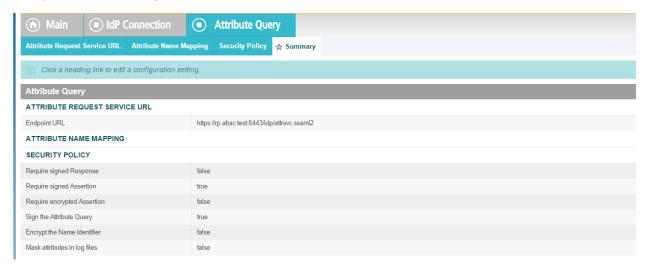

8. Select Sign the Attribute Query.

6166

6167

9. Verify that the **Summary** is correct, then click **Done**.

6168 6169

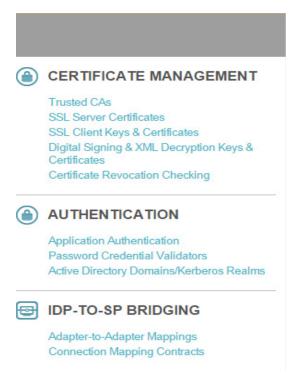

10. When the following screen appears, click **Next**.

6170 6171

11. JIT provisioning details have been provided by PingFederate here.

- 6172 12. **Save** the configuration.
- 13. Select **Application Authentication**.

6175 6176

6177

- 14. Enter **appid** in the **ID** field, and use the shared secret that you input during custom data store configuration, then save the configuration.
- 15. Select **Browser SSO** and **Attribute Query.**

6179 10.9 ApacheDS Schema Extension

NIST SP 1800-3C: Attribute Based Access Control

- At a high level, LDAP Schema is the collection of attribute type definitions, object class definitions, and other information which a server uses to determine how to match a filter or attribute value assertion (in a compare operation) against the attributes of an entry, and whether to permit add and modify operations. For a more formal definition, look into Section 4.1 of RFC 4512.
- ApacheDS comes with a comprehensive set of predefined, standardized schema elements. Specification of many of these elements can be found in <u>RFC 4519</u>. Generally, these predefined schema satisfy most

or many or these elements can

6186	of the needs of a project. However, you may sometimes be required to define additional attributes or
6187	object classes that are not included in the server provided schema.

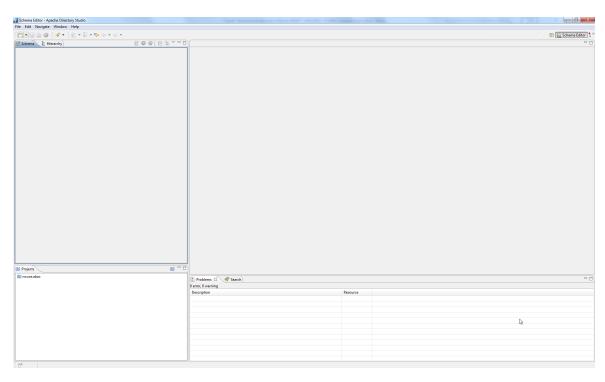

- 6188 Each attribute and object class has an associated unique Object Identifier. Generally, An Object
- 6189 Identifier is a tree of nodes where each node is simply a sequence of digits. The rules roughly state that
- once an entity is assigned a node in the Object Identifier (OID) tree, it has sole discretion to further
- delegate sub-trees off of that node. Some examples of OIDs include: 1.3.6.1 the Internet OID,
- 6192 1.3.6.1.4.1 IANA-assigned company OIDs. It is formally defined using the ITU-T's ASN.1 standard, X.690.
- 6193 The IANA OID registry contains a list of registered entities that use OIDs to reference internal structures.
- 6194 In this section, we have used OIDs that are not registered anywhere. For this reason, we are using the
- subtree 2.25, as per recommendation by <u>ITU</u>. UUID is generated by the program found <u>here</u>.
- In the following section, we will demonstrate how to create an attribute. Similar procedures can be used
- to create many attributes and object classes.
- 6198 10.9.1 Pre-Requisites
- 6199 For Schema extension, this project used ApacheDS studio. ApacheDS installation and configuration is
- 6200 detailed in Section 10.6 of this guide.
- 6201 10.9.2 Procedure

6203

1. Start ApacheDS Studio from the Start menu.

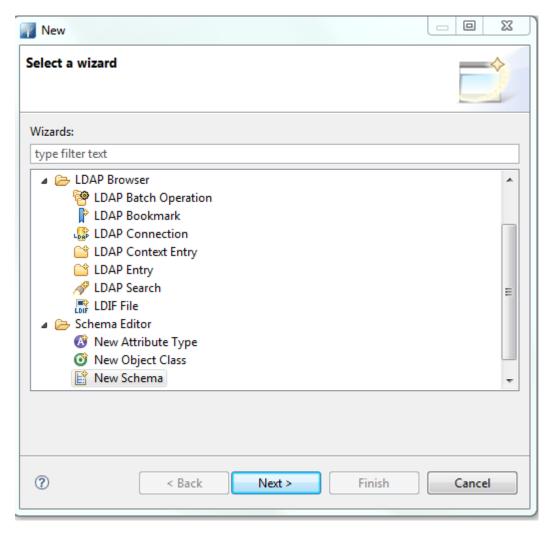

6204 2. The following screen will appear:

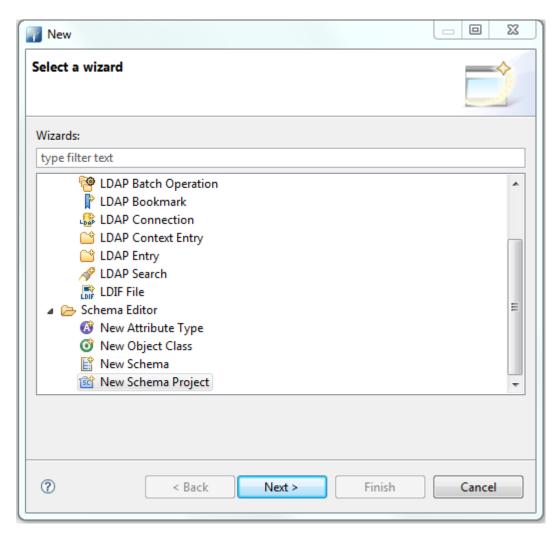

6205 6206

3. Select **File > New**.

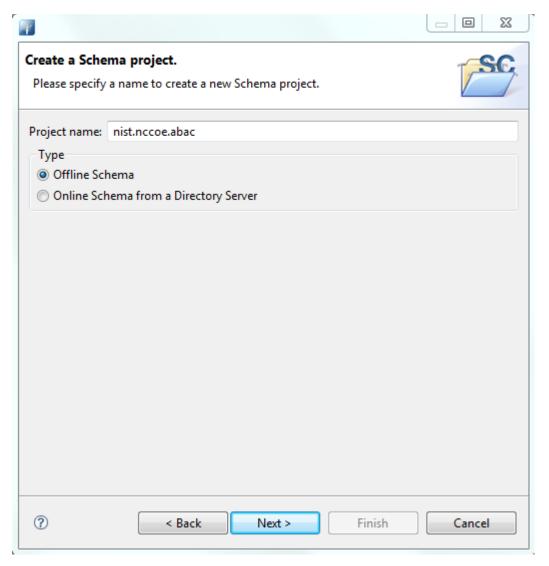

6208

4. Select the **New Schema Project** wizard.

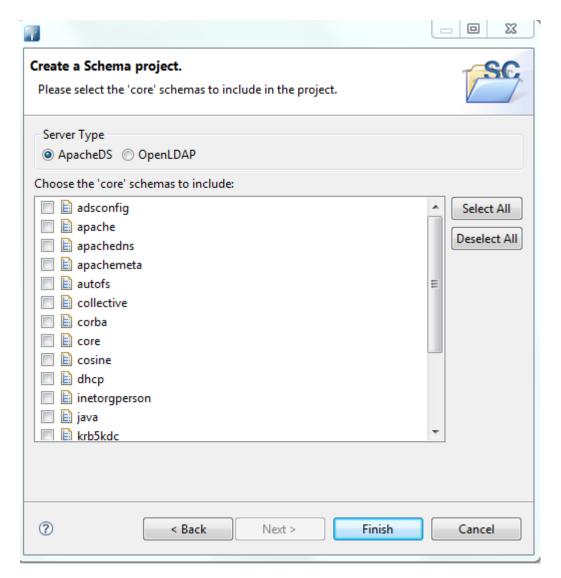

6210

5. Specify a **Project name**, i.e., **nist.nccoe.abac** in our build.

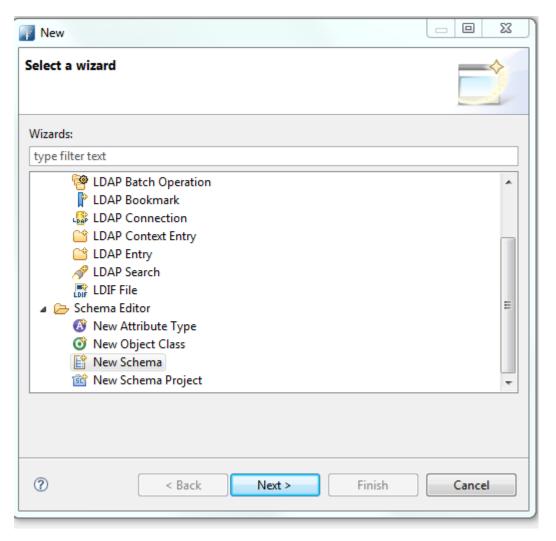

6213

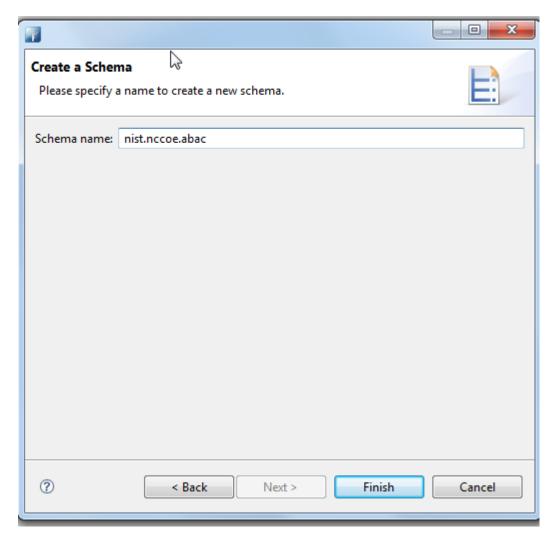

6. Select **Offline Schema**, then click **Next**. On the next screen, **Choose the 'core' schemas to include**.

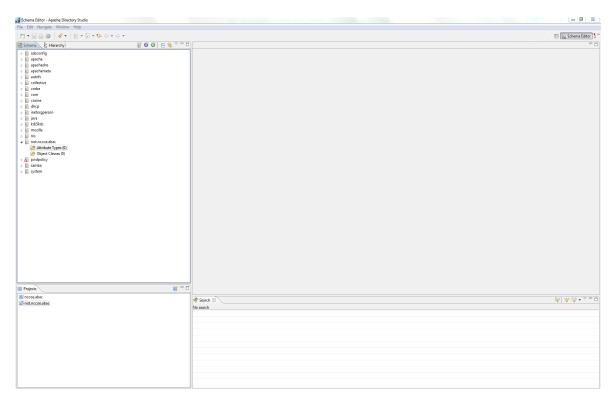

7. Click File > New and select New Schema.

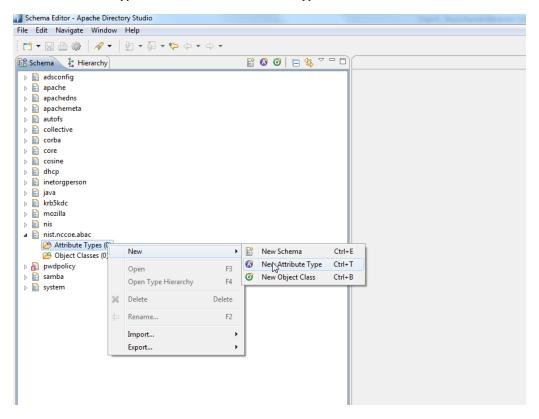

8. Specify a **Schema name**, i.e., **nist.nccoe.abac** in our build.

9. The following screen will appear:

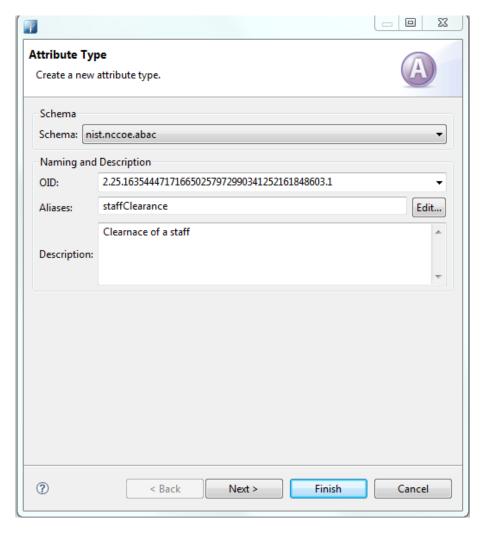

10. Select Attribute Types > New > New Attribute Type.

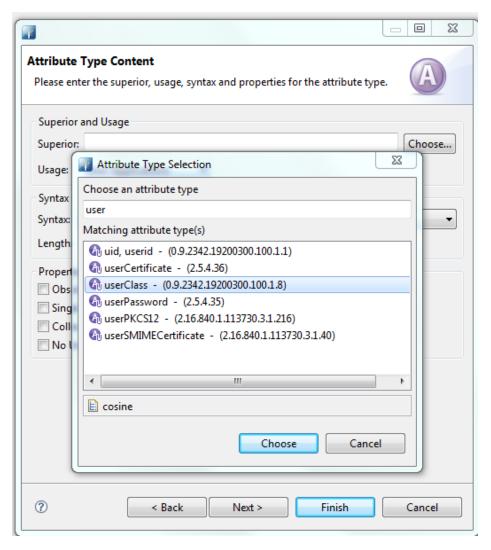

62226223

11. In the new window, choose the **OID** from the previous instructions.

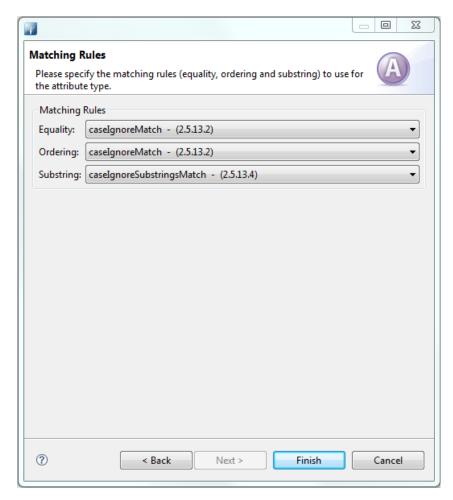

6225

12. Click **Next** to choose the superior type of this attribute.

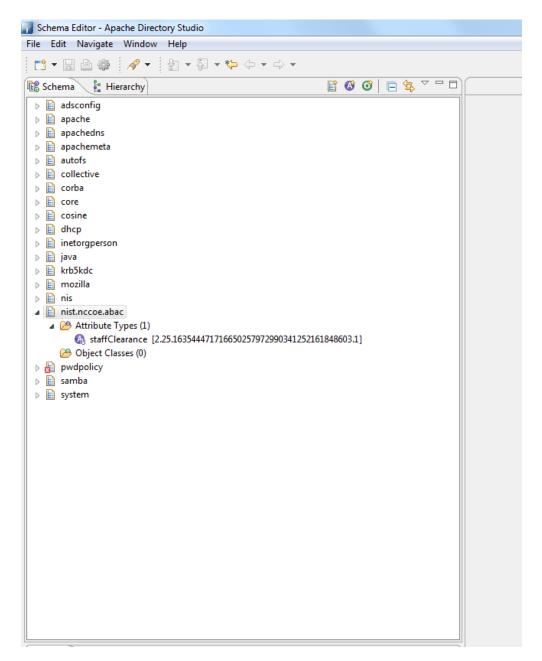

13. Specify Matching Rules. Since it is a string, case insensitivity is chosen in our build.

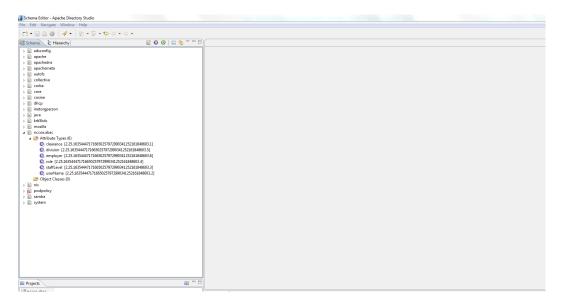

6229

14. The following screen will appear:

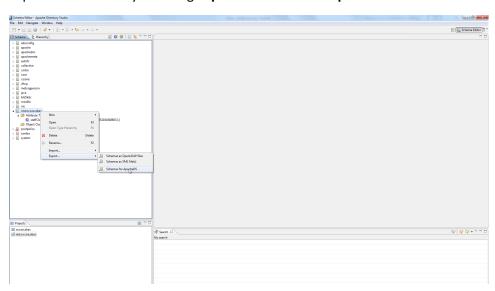

15. You can create other attributes by following process described above.

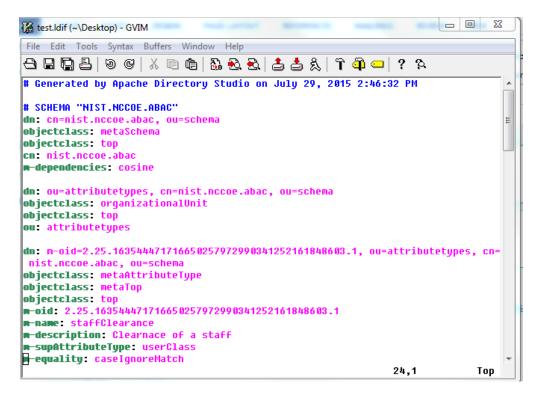

62326233

16. Export the schema by selecting **Export > Schemas for ApacheDS**. It will create an LDIF file.

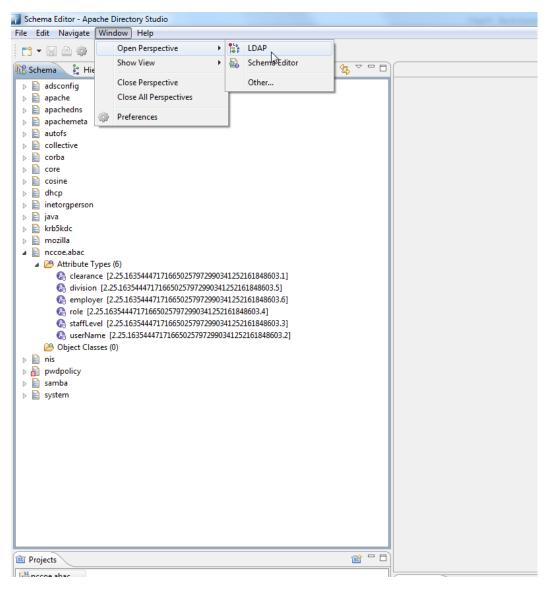

62346235

17. LDIF files are specified by their own RFC. In a text editor, it displays as following:

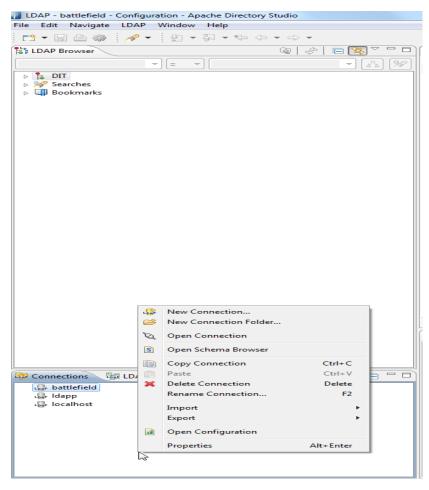

6237

18. To import the file, first select **Window > Open Perspective > LDAP**.

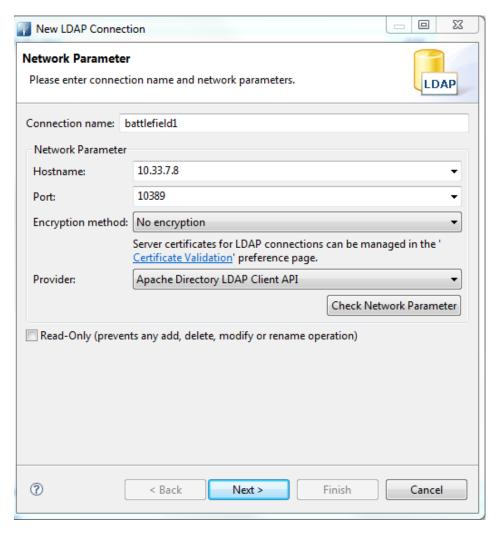

19. Click on the left bottom corner of the window and select **New Connection**.

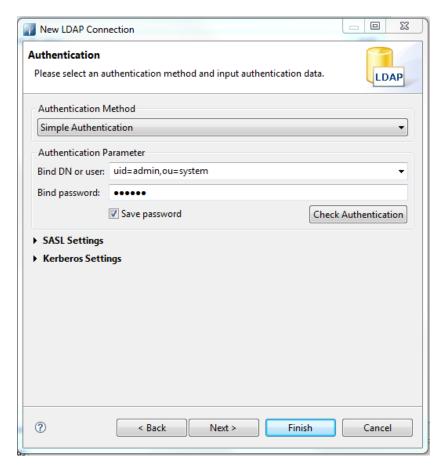

6240

6241 20. Fill in the network parameters and click **Next**.

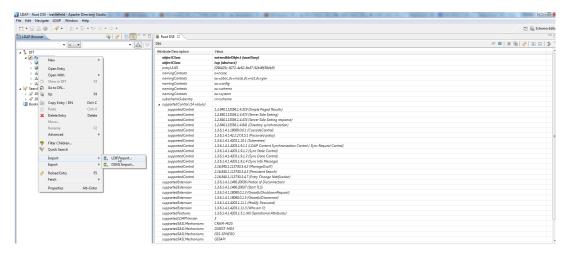

21. Provide credentials and click Finish.

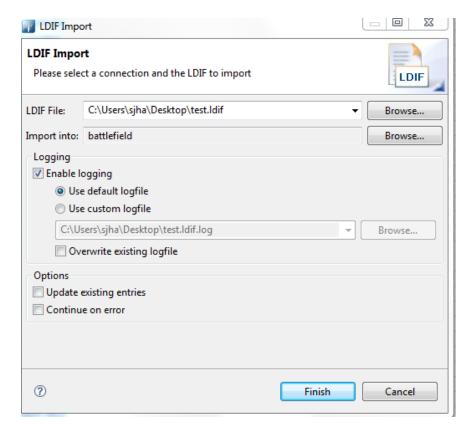

6245

22. Open **Schema Editor Browser** and import the LDIF file created in the previous step.

6246

6247

- 6248 23. Click **Finish**.
- 6249 24. To verify success, the log file generated at the end of the import should show **RESULT OK**.

6251

6264

6265

6266

6267

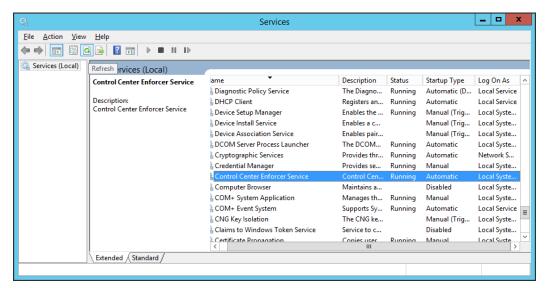

10.10 Functional Tests

- Once all requirements have been met and all steps in this How-To Guide have been executed, a few functional tests will ensure that the key components of this How-To Guide were correctly deployed and are communicating with other ABAC components as desired.
- The first functional test will check the ready state of the NextLabs Policy Controller (ensures that it is running after being paused for plugin deployment).
- The second test will check that the plugin was successfully loaded into the NextLabs software
 architecture, that an attribute request is sent to the Protocol Broker from the NextLabs PIP plugin's
 getAttribute() function, and that the Protocol Broker responds with an expected attribute value.
- The second functional test will ensure that the Protocol Broker is successfully loaded and deployed within the tomcat server instance.
- Both of these functional tests can be done on the SharePoint server.

6263 10.10.1 Testing the Ready State of the NextLabs Policy Controller Service

- 1. Click on the Windows icon and begin typing the word services.
- 2. When the Services application icon appears, double-click to open the Services application.
 - 3. Within the Services application window, click on the Name column and look for **Control Center Enforcer Service.**

4. Verify that the status column reads **Running.**

6269

6278

- 10.10.2 Test the Successful Loading of the Custom Plugin Within the NextLabs Policy
 Controller Software Architecture
- 6272 1. Click on the Windows icon.
- 6273 2. Begin typing Windows Explorer.
- 3. Click on the Windows Explorer application icon.
- 6275 4. Navigate to C:/Program Files/NextLabs/Policy Controller/agentLog/.
- 5. Within the **agentLog** folder, note the **Agentlog0.0** file.
- 6. Within the agentLog folder, copy and paste the locked file Agentlog0.log0 to open it for review.
 - a. Left-click on the file name, and hold down Ctrl+C.
- 6279 b. Left-click anywhere in the agentLog folder, right-click and hold down Ctrl+V.
- 6280 7. Double-click the **Agent0.log-Copy.0** file to open it in your default text editor.
- 8. Within your default text editor, use a search function to search for standard NextLabs logging terminology to verify that the plugin was loaded correctly. Example:

```
6283
              Jul 13, 2015 4:59:21 PM com.bluejungle.pf.domain.destiny.serviceprovider.c A
6284
              FINE: Loading C:\Program Files\NextLabs\Policy
6285
              Controller\.\jservice\config\nlsamlpluginService.properties
6286
              Jul 13, 2015 4:59:21 PM com.bluejungle.pf.domain.destiny.serviceprovider.c A
6287
              FINE: Loading C:\Program Files\NextLabs/Policy
6288
              Controller/jservice/jar/nlsamlplugin/NLSAMLPlugin-0.0.1-SNAPSHOT-jar-with-
6289
              dependencies.jar
6290
              Jul 13, 2015 4:59:22 PM
6291
              com.bluejungle.pf.domain.destiny.serviceprovider.ServiceProviderManager
```

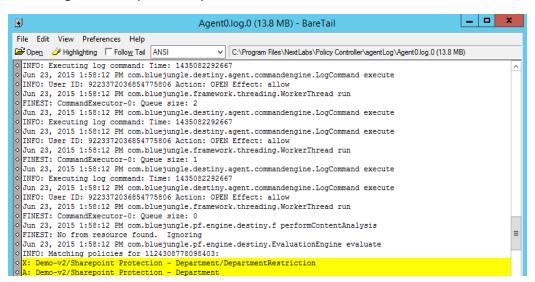

6292 register
6293 INFO: A new Service 'NLSAMLPlugin_Service' is registered.

9. Within your default text editor, use a search function to search for logging statements you included in your plugin code to verify that the init() methods are called while the jar is loaded within NextLabs (standard according to NextLabs support). Example:

```
Jul 13, 2015 4:59:21 PM gov.nist.NLSAMLPlugin.UserAttrProviderMod init INFO: NLSAMLPlugin UserAttrProviderMod code -- init method Jul 13, 2015 4:59:21 PM gov.nist.NLSAMLPlugin.HTTPSTransmitter init
```

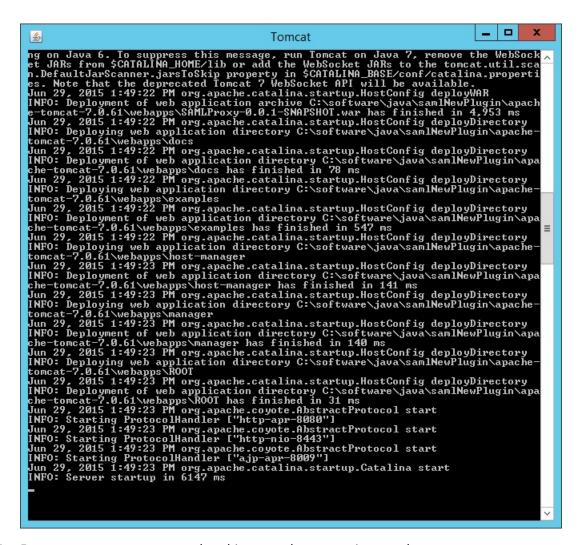

You can copy and paste the locked file, or keep a live annotating tool open that will display the contents of Agento.log0 as new log statements are recorded. Example from this implementation: **BareTail by Bare Metal Software Pty Ltd.**

Example screenshot using BareTail to open the **Agent0.log0** file, with optional highlighting illustrating evaluated policies in yellow:

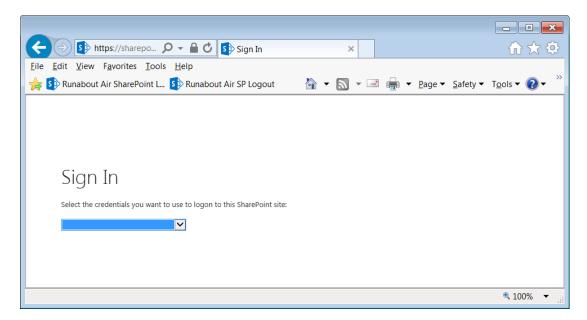

10.10.3 Testing That the Protocol Broker .war File Loads Correctly in Tomcat Server

- 1. On the SharePoint Server, open Services, and ensure that the **Control Center Enforcer Service** is listed as **Running**.
- 2. Using Windows Explorer, navigate to your Apache tomcat installation within the Windows file structure. Example: *C: /software/apache-tomcat-7.0.61*
- 3. **Double-click to open the bin folder.** Example: C:/software/apache-tomcat-7.0.61/bin
- 6312 4. Double-click **startup.bat** to start the bat, and wait for startup to complete.

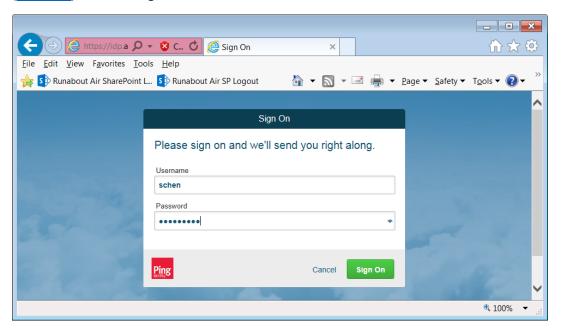

- 6313
- 5. From any computer connected to this network, open an internet browser.
- 6315 6. In the address field, type https://sharepoint.abac.test/ and press Enter.
- 7. Choose **Federated Logon** from the drop-down menu.

6318

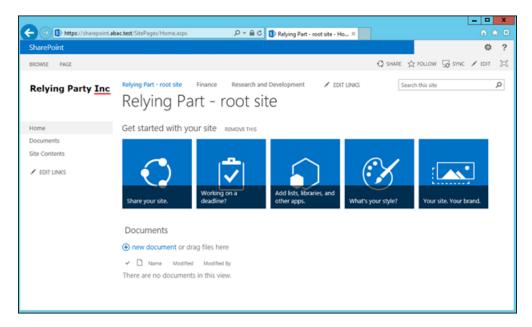

6319

8. At the login screen, enter the credentials of a user that exists in your IdP Active Directory (Section 2), and click **Sign On**.

6320 6321

9. Verify that the user was able to access the main page of the RP's SharePoint. Example:

6324

6325

6326

6327 6328

6329

6330

6331 6332

6333

- 10. In the SharePoint site, double-click on an object for which you know the user will be missing an attribute in order to be granted access, but that can be retrieved via a secondary attribute request using the NextLabs PIP plugin, Protocol broker, and Ping custom data store.
- 11. Follow the remaining steps 15-18 to verify through standard and custom logging that the Protocol Broker was loaded, that the getAttribute() from the NextLabs PIP plugin was sent, and an expected attribute value was returned.
- 12. In Windows Explorer, navigate to your installation of Apache tomcat and locate its log files, i.e., *C:/software/apache-tomcat-7.0.61/logs*
- 13. Open a catalina.____.log file using your default text editor and use a search function to find standard Apache tomcat logging that indicates the .war file was correctly deployed and loads without error. For example, in *C:/software/apache-tomcat-7.0.61/logs/catalina.2015-06-29.log:*

```
6334
