ds-nccoe@nist.gov

1 The National Cybersecurity Center of Excellence (NCCoE), a part of the National Institute of
2 Standards and Technology (NIST), is a collaborative hub where industry organizations,
3 government agencies, and academic institutions work together to address businesses' most
4 pressing cybersecurity challenges. Through this collaboration, the NCCoE develops modular,
5 easily adaptable example cybersecurity solutions demonstrating how to apply standards and
6 best practices by using commercially available technology. To learn more about the NCCoE, visit
7 <https://www.nccoe.nist.gov>. To learn more about NIST, visit <https://www.nist.gov>.

8 This document describes a problem that is relevant to many industry sectors. NCCoE
9 cybersecurity experts will address this challenge through collaboration with a Community of
10 Interest, including vendors of cybersecurity solutions. The resulting reference design will detail
11 an approach that can be incorporated across multiple sectors.

12 **ABSTRACT**

13 An organization must protect its information from unauthorized access and disclosure. Data
14 breaches large and small can have far-reaching operational, financial, and reputational impacts.
15 The goal of this project is to provide a practical solution to detect, respond to, and recover from
16 incidents that affect data confidentiality. The architecture described seeks to provide the
17 technical capabilities needed by an organization to maintain full awareness of its data as well as
18 mitigate the effects of a data breach. The implementation will include data and network
19 monitoring, event detection, and other potential technologies. The project team will create a
20 reference design and a detailed description of the practical steps needed to implement a secure
21 solution based on standards and best practices. This project will result in a freely available NIST
22 Cybersecurity Practice Guide.

23 **KEYWORDS**

24 *data breach; data confidentiality; data loss; data protection; malware; ransomware; spear*
25 *phishing*

26 **DISCLAIMER**

27 Certain commercial entities, equipment, products, or materials may be identified in this
28 document in order to describe an experimental procedure or concept adequately. Such
29 identification is not intended to imply recommendation or endorsement by NIST or NCCoE, nor
30 is it intended to imply that the entities, equipment, products, or materials are necessarily the
31 best available for the purpose.

32 **COMMENTS ON NCCoE DOCUMENTS**

33 Organizations are encouraged to review all draft publications during public comment periods
34 and provide feedback. All publications from NIST's National Cybersecurity Center of Excellence
35 are available at <https://www.nccoe.nist.gov>.

36 Comments on this publication may be submitted to ds-nccoe@nist.gov.

37 Public comment period: June 24, 2019, to July 29, 2019

62 1 EXECUTIVE SUMMARY

63 Purpose

64 This document defines a National Cybersecurity Center of Excellence (NCCoE) project to provide
65 guidance and a reference architecture that will assist an organization to detect, respond to, and
66 recover from a loss of data confidentiality. Data confidentiality refers to protection of data from
67 unauthorized access and disclosure, including means for protecting personal privacy and
68 proprietary information. Confidentiality is relevant for data at rest, in use, and in transit. Lapses
69 in data confidentiality can lead to a data breach. A breach may include internal and/or external
70 unauthorized access or disclosure. According to the 2018 Cost of Data Breach Study conducted
71 by Ponemon Institute and sponsored by IBM [1], the worldwide average cost of a data breach in
72 2018 was \$3.55 million.

73 NCCoE projects include technical guidance and a reference architecture that addresses a
74 technical challenge. An example implementation integrates commercial and open-source
75 products to demonstrate how to incorporate standards and best practices. This project will
76 result in a publicly available National Institute of Standards and Technology (NIST) Cybersecurity
77 Practice Guide, a detailed implementation guide of the practical steps needed to implement a
78 cybersecurity reference design that addresses this challenge.

79 Scope

80 This project will answer the following questions related to detecting, responding to, and
81 recovering from data confidentiality events:

- 82 • What is the baseline activity of systems, networks, and users?
- 83 • When has a data confidentiality event occurred, and what was the impact?
- 84 • How will an established response plan be executed?
- 85 • How will incidents be contained and mitigated?
- 86 • What type of recovery plan should be designed and executed?

87 This project will address:

- 88 • a network baselining solution to establish normal parameters for activity
- 89 • an event detection solution with components that monitor:
 - 90 ○ systems for confidentiality events
 - 91 ○ networks for unusual activity and potential cybersecurity events
 - 92 ○ users for all activities, including unusual or unauthorized activity
 - 93 ○ data for attempted unauthorized access or movement
- 94 • an event data aggregation and correlation solution to assist in detection of and response
95 to a data confidentiality event
- 96 • a file access monitoring solution to produce logs and alerts
- 97 • an exfiltration detection and mitigation solution to prevent data confidentiality loss
- 98 • tools that aid in identification of information that is necessary for a data confidentiality
99 recovery event

100 This project will not address data security issues related to integrity or availability. This includes
101 violations of machine integrity that can lead to loss of data confidentiality; for example, a
102 compromised active directory server that allows unauthorized access to network machines. For

103 more information about issues of data integrity, please see the Data Integrity series of the data
104 security projects, found at <https://www.nccoe.nist.gov/projects/building-blocks/data-security>.

105 **Assumptions/Challenges**

106 **Security Team**

107 The size, budget, and expertise of members of a security team vary significantly among
108 organizations. Both detection of and, to a larger degree, response to a data confidentiality event
109 depend on qualified security employees to analyze and act on the data presented by
110 cybersecurity tools. This project will make assumptions about the core competencies of an
111 organization's security team.

112 **Implementation Decisions**

113 There is a trade-off between the strength of protections on data and the time and resources
114 spent maintaining those protections. An organization should make risk-based decisions as to
115 what data should be considered sensitive for the organization and what warrants extra
116 protections. This project will assume that organizations can identify their at-risk data and tune
117 the final reference architecture to reflect their risk management policy. The reference
118 architecture will aim to include tools that will allow organizations to classify data as sensitive
119 and at risk. However, we will not be able to provide guidance as to what data should be
120 considered sensitive and at risk.

121 **Recovery Capabilities**

122 Given that data breaches refer to disclosure of data to unauthorized parties, removing the data
123 from those unauthorized entities and restoring the original restrictions are nearly impossible,
124 especially if the loss of confidentiality was executed maliciously. Thus, recovery from a data
125 confidentiality attack is not a technological implementation issue; it is a policy-based response.
126 This project will attempt to provide guidance on what artifacts from the event are relevant to
127 the recovery response.

128 **Background**

129 The first group of data security projects at the NCCoE focused on data integrity (DI). The NIST
130 Special Publications covered the ability to protect DI, detect and respond to attacks that impact
131 DI, and recover DI after an attack [2]. During presentations, demonstrations, Community of
132 Interest calls, and other feedback mechanisms, many questions were raised related to data
133 breaches and inclusion of technologies to prevent such attacks. These attacks (and therefore
134 incorporation of their mitigating technologies) were outside the scope of DI. They were
135 categorized as data confidentiality challenges.

136 During the Data Integrity Project, the NCCoE engaged with consumer-facing and retail
137 organizations and e-commerce payment stakeholders such as information sharing and analysis
138 centers and the Retail Cyber Intelligence Sharing Center (now known as the Retail and
139 Hospitality Intelligence Sharing and Analysis Center). Through these engagements, the need for
140 data confidentiality projects was identified.

141 This project will provide guidance on data confidentiality together with the Identifying and
142 Protecting Assets and Data from Data Breaches Project. The NCCoE chose to address data
143 confidentiality in two parallel projects to provide modular, adaptable guidance rather than an
144 all-or-nothing approach. In addition, two projects allow for multiple perspectives into scenarios
145 for preventing and reacting to a data breach or other loss of data confidentiality. In summary,

146 securing a system by identifying and protecting against threats requires technologies, planning,
147 and training that are different from detecting, responding to, and recovering from a breach.

148 **2 SCENARIOS**

149 The example scenarios below illustrate some of the challenges that this project will address.

150 **Scenario 1: Exfiltration of Encrypted Data**

151 An organization unknowingly has a compromised machine that is being used by a malicious
152 actor to exfiltrate data. The malicious actor is encrypting the data to prevent detection.

153 The data confidentiality solution will provide monitoring capabilities to help recognize the active
154 breach. The solution will also notify the security team of the activity and respond in accordance
155 with policy that stops the continued data leak (e.g., prevents access to the data).

156 **Scenario 2: Spear Phishing Campaign**

157 As a result of a spear phishing campaign, a malicious actor can view and manipulate a database.
158 Proprietary internal data stored in the database is exposed.

159 The data confidentiality solution will provide monitoring for the security team to recognize that
160 data has been accessed and/or exfiltrated. The solution will also respond with actions that
161 immediately terminate access for the malicious actor to the database.

162 **Scenario 3: Ransomware**

163 An employee is a victim of ransomware and is presented with a note showing contents of
164 proprietary files from the employee's organization's file server and a demand for money to stop
165 the access and sharing of files.

166 The data confidentiality solution will provide monitoring and logging to determine the scope and
167 severity of a data breach. The results from the monitoring solution will inform the appropriate
168 response to discontinue the data leak.

169 **Scenario 4: Accidental Email**

170 A user accidentally cc's an individual who should not have access to the email's attachment,
171 which contains proprietary information.

172 The data confidentiality solution will detect that access is being issued to an individual not
173 authorized and will produce an alert of the error.

174 **Scenario 5: Lost Laptop**

175 A user loses their laptop that contains proprietary company information.

176 The data confidentiality solution will determine what information was in the laptop and
177 potentially try to remote-delete data.

178 **Scenario 6: Privilege Misuse**

179 An employee, leveraging administrator credentials, accesses data to exfiltrate that data for
180 personal gain. The employee prints several sensitive documents and then exfiltrates the
181 remaining data via Universal Serial Bus (USB).

182 The data confidentiality solution will provide monitoring capabilities to allow the security team
183 to recognize that data has been exfiltrated via unallowable media type. The solution will also
184 respond with appropriate actions to immediately stop the user from continued access.

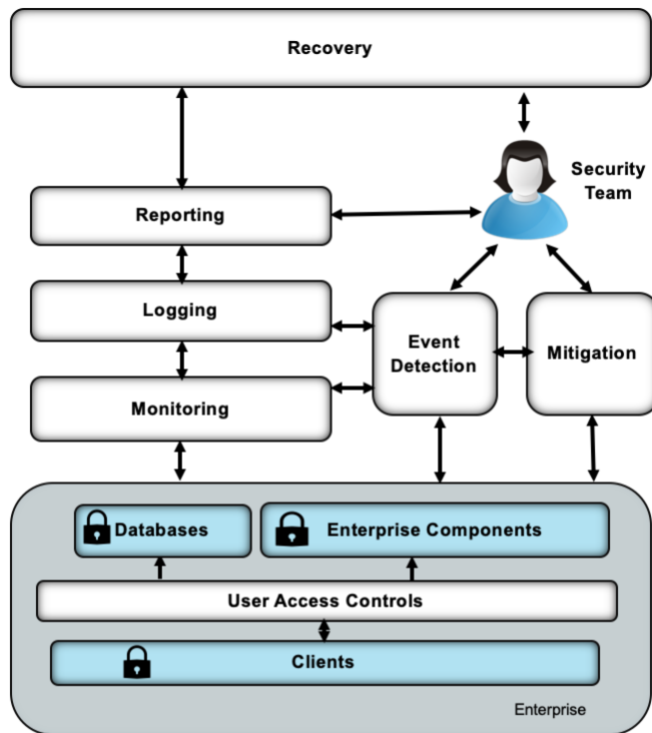

185 **Scenario 7: Eavesdropping**

186 An external actor compromises an organization’s network and can hijack network
187 communications via a man-in-the-middle attack, resulting in data loss.

188 The data confidentiality solution will detect unauthorized network access and respond
189 appropriately to sever the connection.

190 **3 HIGH-LEVEL ARCHITECTURE**

191 The figure below depicts the proposed high-level architecture that integrates suggested
192 capabilities to address detect, respond, and recover functions.

Legend
←→ Organizational Data Flow

193

194 **Component List**

195 Solutions for this project include:

- 196 • monitoring
 - 197 ○ file
 - 198 ○ network

- 199 ○ users
- 200 ● event detection
- 201 ○ exfiltration activity
- 202 ○ unauthorized activity
- 203 ○ anomalous activity
- 204 ● log collection, collation, and correlation of all activities within the enterprise
- 205 ● reporting events to the security team
- 206 ● mitigating data loss

207 Desired Requirements

208 To address the scenarios in Section 2, this project will use commercially available technologies.
 209 The solution will demonstrate the Detect, Respond, and Recover categories of the Cybersecurity
 210 Framework [3]. The solution will:

- 211 ● Monitor the enterprise's user and data activity.
- 212 ● Detect unauthorized data flows, user behavior, and data access.
- 213 ● Report unauthorized activity with respect to users and data in transit, at rest, or in use
 214 to centralized monitoring and reporting software.
- 215 ● Analyze the impact of unauthorized behavior and malicious behavior on the network or
 216 end points. Determine if a loss of data confidentiality is occurring or has occurred.
- 217 ● Mitigate the impact of such losses of data confidentiality by facilitating an effective
 218 response to a data breach scenario.
- 219 ● Contain the effects of a data breach so that more data is not exposed.
- 220 ● Facilitate the recovery effort from data breaches by providing detailed information as to
 221 the scope and severity of the breach.

| Data Loss | <p>The alteration or deletion of proprietary, sensitive, personal, or otherwise critical data.</p> <p>Note: The definition in NIST Interagency/Internal Report 7298 describes data loss as a loss of confidentiality; for example, when data is stolen and leaked. Here, we refer to data loss as data being destroyed in some way.</p> |
| Encryption | <p>Conversion of plaintext to ciphertext through a cryptographic algorithm.</p> <p>PARAPHRASED FROM FIPS 185</p> |
| Enterprise | <p>An organization with a defined mission/goal and a defined boundary. It uses information systems to execute that mission and is responsible for managing its own risks and performance. An enterprise may consist of all or some of the following business aspects: acquisition, program management, financial management (e.g., budgets), human resources,</p> |

security, information systems, and information and mission management.

PARAPHRASED FROM CNSSI-4009

Exfiltration The unauthorized transfer of information from an information system.

SOURCE: CNSSI 4009-2015

Incident A violation or imminent threat of violation of computer security policies, acceptable use policies, or standard security practices.

SOURCE: NIST SP 800-61

Impact The magnitude of harm that can be expected to result from unauthorized disclosure of information, unauthorized modification of information, unauthorized destruction of information, or loss of information or information system availability.

PARAPHRASED FROM NIST SP 800-60

Malware A program that is inserted into a system, usually covertly, with the intent of compromising the confidentiality, integrity, or availability of the victim's data, applications, or operating system or of otherwise annoying or disrupting the victim.

SOURCE: NIST SP 800-83

Phishing Tricking individuals into disclosing sensitive personal information through deceptive computer-based means.

SOURCE: NIST SP 800-83

Ransomware A type of malicious software, or malware, designed to deny access to a computer system or data until a ransom is paid.

SOURCE: <https://www.us-cert.gov/Ransomware>

Threat Any circumstance or event with the potential to adversely impact organizational operations (including mission, functions, image, and reputation), organizational assets, individuals, other organizations, or the nation through an information system via unauthorized access, destruction, disclosure, modification of information, and/or denial of service.

PARAPHRASED FROM NIST SP 800-53; NIST SP 800-53A; NIST SP 800-27; NIST SP 800-60; NIST SP 800-37; CNSSI-4009
