## FEEDBACK

As a private-public partnership, we are always seeking feedback on our practice guides. We are particularly interested in seeing how businesses apply NCCoE reference designs in the real world. If you have implemented the reference design, or have questions about applying it in your environment, please email us at [mitigating-iot-ddos-nccoe@nist.gov](mailto:mitigating-iot-ddos-nccoe@nist.gov).

All comments are subject to release under the Freedom of Information Act.

## NATIONAL CYBERSECURITY CENTER OF EXCELLENCE

The National Cybersecurity Center of Excellence (NCCoE), a part of the National Institute of Standards and Technology (NIST), is a collaborative hub where industry organizations, government agencies, and academic institutions work together to address businesses' most pressing cybersecurity issues. This public-private partnership enables the creation of practical cybersecurity solutions for specific industries, as well as for broad, cross-sector technology challenges. Through consortia under Cooperative Research and Development Agreements (CRADAs), including technology partners—from Fortune 50 market leaders to smaller companies specializing in information technology security—the NCCoE applies standards and best practices to develop modular, adaptable example cybersecurity solutions using commercially available technology. The NCCoE documents these example solutions in the NIST Special Publication 1800 series, which maps capabilities to the NIST Cybersecurity Framework and details the steps needed for another entity to re-create the example solution. The NCCoE was established in 2012 by NIST in partnership with the State of Maryland and Montgomery County, Maryland.

To learn more about the NCCoE, visit <https://www.nccoe.nist.gov/>. To learn more about NIST, visit <https://www.nist.gov>.

## NIST CYBERSECURITY PRACTICE GUIDES

NIST Cybersecurity Practice Guides (Special Publication 1800 series) target specific cybersecurity challenges in the public and private sectors. They are practical, user-friendly guides that facilitate the adoption of standards-based approaches to cybersecurity. They show members of the information security community how to implement example solutions that help them align with relevant standards and best practices, and provide users with the materials lists, configuration files, and other information they need to implement a similar approach.

The documents in this series describe example implementations of cybersecurity practices that businesses and other organizations may voluntarily adopt. These documents do not describe regulations or mandatory practices, nor do they carry statutory authority.

## ABSTRACT

The goal of the Internet Engineering Task Force's Manufacturer Usage Description (MUD) specification is for Internet of Things (IoT) devices to behave as intended by the manufacturers of the devices. MUD provides a standard way for manufacturers to indicate the network communications that a device requires to perform its intended function. When MUD is used, the network will automatically permit the IoT device to send and receive only the traffic it requires to perform as intended, and the network will prohibit all other communication with the device, thereby increasing the device's resilience to network-based attacks. In this project, the NCCoE demonstrated the ability to ensure that when an IoT device connects to a home or small-business network, MUD can automatically permit the device to send and

receive only the traffic it requires to perform its intended function. This NIST Cybersecurity Practice Guide explains how MUD protocols and tools can reduce the vulnerability of IoT devices to botnets and other network-based threats as well as reduce the potential for harm from exploited IoT devices. It also shows IoT device developers and manufacturers, network equipment developers and manufacturers, and service providers who employ MUD-capable components how to integrate and use MUD to satisfy IoT users' security requirements.

## KEYWORDS

*access control; bootstrapping; botnets; firewall rules; flow rules; Internet of Things (IoT); Manufacturer Usage Description (MUD); network segmentation; onboarding; router; server; software update server; threat signaling; Wi-Fi Easy Connect.*

## DOCUMENT CONVENTIONS

The terms “shall” and “shall not” indicate requirements to be followed strictly to conform to the publication and from which no deviation is permitted.

The terms “should” and “should not” indicate that, among several possibilities, one is recommended as particularly suitable without mentioning or excluding others or that a certain course of action is preferred but not necessarily required or that (in the negative form) a certain possibility or course of action is discouraged but not prohibited.

The terms “may” and “need not” indicate a course of action permissible within the limits of the publication.

The terms “can” and “cannot” indicate a possibility and capability, whether material, physical, or causal.

Acronyms used in figures can be found in the Acronyms appendix.

## ACKNOWLEDGMENTS

We are grateful to the following individuals for their generous contributions of expertise and time.

# 1 Introduction

This document, *Functional Demonstration Results*, reports the results of the functional evaluation and demonstration of Builds 1, 2, 3, and 4. For each of these builds, we defined a list of requirements unique to that build and then developed a set of test cases to verify that the build meets those requirements. The requirements, test cases, and test results for each of these four builds are documented below.

## 1.1 How to Use this Guide

This National Institute of Standards and Technology (NIST) Cybersecurity Practice Guide demonstrates a standards-based reference design for mitigating network-based attacks by securing home and small-business Internet of Things (IoT) devices. The reference design is modular, and it can be deployed in whole or in part. This practice guide provides users with the information they need to replicate four example Manufacturer Usage Description (MUD)-based implementations of this reference design. These example implementations are referred to as Builds, and this volume describes in detail how to reproduce each one.

This guide contains four volumes:

- NIST SP 1800-15A: *Executive Summary – why we wrote this guide, the challenge we address, why it could be important to your organization, and our approach to solving this challenge*
- NIST SP 1800-15B: *Approach, Architecture, and Security Characteristics – what we built and why, including the risk analysis performed, and the security control map*
- NIST SP 1800-15C: *How-To Guides – instructions for building the example implementations including all the security relevant details that would allow you to replicate all or parts of this project*
- NIST SP 1800-15D: *Functional Demonstration Results – documents the functional demonstration results for the four implementations of the MUD-based reference solution (you are here)*

Depending on your role in your organization, you might use this guide in different ways:

**Business decision makers, including chief security and technology officers**, will be interested in the *Executive Summary*, NIST SP 1800-15A, which describes the following topics:

- challenges that enterprises face in trying to mitigate network-based attacks by securing home and small-business IoT devices
- example solutions built at the National Cybersecurity Center of Excellence (NCCoE)
- benefits of adopting the example solutions

**Technology or security program managers** who are concerned with how to identify, understand, assess, and mitigate risk will be interested in NIST SP 1800-15B, which describes what we did and why. The following sections will be of particular interest:

- Section 3.4, Risk Assessment, describes the risk analysis we performed.
- Section 5.2, Security Control Map, maps the security characteristics of these example solutions to cybersecurity standards and best practices.

You might share the *Executive Summary*, NIST SP 1800-15A, with your leadership team members to help them understand the importance of adopting a standards-based solution for mitigating network-based attacks by securing home and small-business IoT devices.

**IT professionals** who want to implement an approach like this will find this whole practice guide useful. You can use this How-To portion of the guide, NIST SP 1800-15C, to replicate all or parts of one or all four builds created in our lab. This How-To portion of the guide provides specific product installation, configuration, and integration instructions for implementing the example solutions. We do not re-create the product manufacturers' documentation, which is generally widely available. Rather, we show how we incorporated the products together in our environment to create an example solution.

This guide assumes that IT professionals have experience implementing security products within the enterprise. While we have used a suite of products to address this challenge, this guide does not endorse these particular products. Your organization can adopt one of these solutions or one that adheres to these guidelines in whole, or you can use this guide as a starting point for tailoring and implementing parts of a MUD-based solution. Your organization's security experts should identify the products that will best integrate with your existing tools and IT system infrastructure. We hope that you will seek products that are congruent with applicable standards and best practices. NIST SP 1800-15B lists the products that we used in each build and maps them to the cybersecurity controls provided by this reference solution.

A NIST Cybersecurity Practice Guide does not describe "the" solution, but a possible solution. In the case of this guide, it describes four possible solutions. Comments, suggestions, and success stories will improve subsequent versions of this guide. Please contribute your thoughts to [mitigating-iot-ddos-nccoe@nist.gov](mailto:mitigating-iot-ddos-nccoe@nist.gov).

## 1.2 Functional Demonstration Overview

Functional demonstrations were conducted for four implementations of the reference design. These implementations are referred to as *builds*:

- Build 1 uses equipment from Cisco Systems and Forescout. The Cisco MUD Manager is used to provide support for MUD, and the Forescout Virtual Appliances and Enterprise Manager are used to perform non-MUD-related device discovery on the network.

- Build 2 uses equipment from MasterPeace Solutions Ltd., Global Cyber Alliance (GCA), and ThreatSTOP. The MasterPeace Solutions Yikes! router, cloud service, and mobile application are used to support MUD, as well as to perform device discovery on the network and to apply additional traffic rules to both MUD-capable and non-MUD-capable devices based on device manufacturer and model. The GCA Quad9 DNS Service and the ThreatSTOP Threat MUD File Server are used to support threat signaling.
- Build 3 uses equipment from CableLabs. CableLabs Micronets (e.g., Micronets Gateway, Micronets Manager, Micronets mobile phone application, and related service provider cloud-based infrastructure) supports MUD and implements the Wi-Fi Alliance's Wi-Fi Easy Connect protocol to securely onboard devices to the network. It also uses software-defined networking to create separate trust zones (e.g., network segments) called "micronets" to which devices are assigned according to their intended network function.
- Build 4 uses software developed at the NIST Advanced Networking Technologies Laboratory. This software serves as a working prototype for demonstrating the feasibility and scalability characteristics of the MUD Request for Comments (RFC).

For a more comprehensive description of each build and a detailed explanation of each build's architecture and technologies, refer to NIST SP 1800-15B.

### 1.3 Functional Demonstration Activities

All builds were tested to determine the extent to which they correctly implement basic functionality defined within the MUD RFC. Builds 1, 2, and 3 were also subjected to additional exercises that were designed to demonstrate non-MUD-related capabilities. These additional exercises were demonstrative rather than evaluative. They did not verify the build's behavior for conformance to a standard or specification; they were designed to demonstrate advertised capabilities of the builds related to their ability to increase device and network security in ways that are independent of the MUD RFC. These additional capabilities may provide security for both non-MUD-capable and MUD-capable devices. Examples of this type of capability are device discovery, identification and classification, support for threat signaling, and secure, automated onboarding of devices using the Wi-Fi Easy Connect protocol.

### 1.4 Assumptions

The physical architecture of each build as deployed in the NCCoE laboratory environment is depicted and described in NIST SP 1800-15B. Tests for each build were run on the lab architecture documented in NIST SP 1800-15B. Prior to testing each build, all communication paths to the IoT devices on the network were open and could potentially be used to attack systems on the internet. For traffic to be sent between IoT devices, it was required to pass through the router/switch that served as the policy enforcement point (PEP) for the MUD rules.

In the lab setup for each build, the following hosts and web servers were required to be set up and available to support the tests defined below. On the local network where the IoT devices are located,

hosts with the following names must exist and be reachable from an IoT device that is plugged into the local network:

- *unnamed-host* (i.e., a local host that is not from the same manufacturer as the IoT device in question and whose MUD Uniform Resource Locator [URL] is not explicitly mentioned in the MUD file of the IoT device as denoting a class of devices with which the IoT device is permitted to communicate. For example, if device A's MUD file says that it may communicate locally with devices that have MUD URLs [www.zzz.com](http://www.zzz.com) and [www.xxx.com](http://www.xxx.com), then a local host that has a MUD file of [www.qqq.com](http://www.qqq.com) could be *unnamed-host*.)
- *anyhost-to* (i.e., a local host to which the IoT device in question is permitted to initiate communications but not vice versa)
- *anyhost-from* (i.e., a local host that is permitted to initiate communication to the IoT device but not vice versa)
- *same-manufacturer-host* (i.e., a local host that is from the same manufacturer as the IoT device in question. For example, if device A's MUD file is found at URL [www.aaa.com](http://www.aaa.com) and device B's MUD file is also found at URL [www.aaa.com](http://www.aaa.com), then device B could be *same-manufacturer-host*.)

On the internet (i.e., outside the local network), the following web servers must be set up and reachable from an IoT device that is plugged into the local network:

- <https://yes-permit-to.com> (i.e., an internet location to which the IoT device in question is permitted to initiate communications but not vice versa)
- <https://yes-permit-from.com> (i.e., an internet location that is permitted to initiate communications to the IoT device but not vice versa)
- <https://unnamed.com> (i.e., an internet location with which the IoT device is not permitted to communicate)

We also defined several MUD files for each build (provided in each build section below) that were used to evaluate specific capabilities.

## 1.5 Document Conventions

For each build, a set of requirements and a corresponding set of functional test cases were defined to verify that the build meets a specific set of requirements that are unique to that build. For evaluating MUD-related capabilities, these requirements are closely aligned to the order of operations in the [Manufacturer Usage Description Specification \(RFC 8520\)](#). However, even for MUD-specific tests, there are tests that are applicable to some builds but not to others, depending on how any given build is implemented.

For each build, the MUD-related requirements for that build are listed in a table. Each of these requirements is associated with two separate tests, one using Internet Protocol version 4 (IPv4) and one

using IPv6. At the time of testing, however, IPv6 functionality was not fully supported by any of the builds and so was not evaluated. The names of the tests in which each requirement is tested are listed in the rightmost column of the requirements table for each build. Tests that end with the suffix “v4” are those in which IPv4 addressing is used; tests that end with the suffix “v6” are those in which IPv6 addressing is used. Only the IPv4 versions of each test are listed explicitly in this document. For each test that has both an IPv4 and an IPv6 version, the IPv4 version of the test, IoT-n-v4, is identical to the IPv6 version of the test, IoT-n-v6, except:

- IoT-n-v6 devices are configured to use IPv6, whereas IoT-n-v4 devices are configured to use IPv4.
- IoT-n-v6 devices are configured to use Dynamic Host Configuration Protocol version 6 (DHCPv6), whereas IoT-n-v4 devices are configured to use DHCPv4.
- The IoT-n-v6 DHCPv6 message that is emitted includes the MUD URL option that uses Internet Assigned Numbers Authority (IANA) code 112, whereas the IoT-n-v4 DHCPv4 message that is emitted includes the MUD URL option that uses IANA code 161.

Each test consists of multiple fields that collectively identify the goal of the test, the specifics required to implement the test, and how to assess the results of the test. Table 1-1 describes all test fields.

**Table 1-1: Test Case Fields**

Test Case Field	Description
Parent Requirement	Identifies the top-level requirement or the series of top-level requirements leading to the testable requirement
Testable Requirement	Guides the definition of the remainder of the test case fields, and specifies the capability to be evaluated
Description	Describes the objective of the test case
Associated Test Case(s)	In some instances, a test case may be based on the outcome of (an)other test case(s). For example, analysis-based test cases produce a result that is verifiable through various means (e.g., log entries, reports, and alerts).
Associated Cybersecurity Framework Subcategory(ies)	Lists the Cybersecurity Framework Subcategories addressed by the test case

Test Case Field	Description
IoT Device(s) Under Test	Text identifying which IoT device is being connected to the network in this test
MUD File(s) Used	Name of MUD file(s) used
Preconditions	Starting state of the test case. Preconditions indicate various starting-state items, such as a specific capability configuration required or specific protocol and content.
Procedure	Step-by-step actions required to implement the test case. A procedure may consist of a single sequence of steps or multiple sequences of steps (with delineation) to indicate variations in the test procedure.
Expected Results	Expected results for each variation in the test procedure
Actual Results	Observed results
Overall Results	Overall result of the test as pass/fail

Each test case is presented in the format described in Table 1-1.

## 1.6 Document Organization

The remainder of this document describes the evaluation and demonstration activities that were performed for Builds 1, 2, 3, and 4. Each build has a section devoted to it, with that section being divided into subsections that describe the evaluation of MUD-related capabilities and the demonstration of non-MUD-related capabilities (if applicable). The MUD files used for each build are also provided.

Acronyms used in this document can be found in the Acronyms appendix in NIST SP 1800-15B.

## 1.7 Typographic Conventions

The following table presents typographic conventions used in this document.

Typeface/ Symbol	Meaning	Example
<i>Italics</i>	file names and path names; references to documents that are not hyperlinks; new terms; and placeholders	For language use and style guidance, see the <i>NCCoE Style Guide</i> .
<b>Bold</b>	names of menus, options, com- mand buttons, and fields	Choose <b>File &gt; Edit</b> .
Monospace	command-line input, onscreen computer output, sample code examples, status codes	Mkdir
<b>Monospace Bold</b>	command-line user input con- trasted with computer output	<b>service sshd start</b>
<a href="#">blue text</a>	link to other parts of the docu- ment, a web URL, or an email address	All publications from NIST's NCCoE are availa- ble at <a href="https://www.nccoe.nist.gov">https://www.nccoe.nist.gov</a> .

## 2 Build 1

Build 1 uses equipment from Cisco Systems and Forescout. The Cisco MUD Manager is used to support MUD and the Forescout Virtual Appliances, and Enterprise Manager is used to perform non-MUD-related device discovery on the network.

### 2.1 Evaluation of MUD-Related Capabilities

The functional evaluation that was conducted to verify that Build 1 conforms to the MUD specification was based on the Build 1-specific requirements defined in Table 2-1.

#### 2.1.1 Requirements

Table 2-1: MUD Use Case Functional Requirements

Capability Requirement (CR-ID)	Parent Requirement	Subrequirement 1	Subrequirement 2	Test Case
CR-1	The IoT DDoS example implementation shall include a mechanism for associating a device with a MUD file URL (e.g., by having the MUD-enabled <b>IoT device emit a MUD file URL via DHCP, Link Layer Discovery Protocol [LLDP], or X.509 or by using some other mechanism to enable the network to associate a device with a MUD file URL</b> ).			IoT-1-v4, IoT-1-v6, IoT-11-v4, IoT-11-v6
CR-1.a		Upon initialization, the MUD-enabled IoT device shall broadcast a DHCP message on the network, including at most one <b>MUD URL, in hyper-</b>		IoT-1-v4, IoT-1-v6, IoT-11-v4, IoT-11-v6

Capability Requirement (CR-ID)	Parent Requirement	Subrequirement 1	Subrequirement 2	Test Case
		text transfer protocol secure ( <b>https</b> ) scheme, within the DHCP transaction.		
CR-1.a.1			The DHCP server shall be able to receive <b>DHCPv4 DISCOVER and REQUEST with IANA code 161</b> (OPTION_MUD_URL_V4) from the MUD-enabled IoT device.	IoT-1-v4, IoT-11-v4
CR-1.a.2			The DHCP server shall be able to receive <b>DHCPv6 Solicit and Request with IANA code 112</b> (OPTION_MUD_URL_V6) from the MUD-enabled IoT device.	IoT-1-v6, IoT-11-v6
CR-1.b		Upon initialization, the MUD-enabled IoT device shall <b>emit the MUD URL as an LLDP extension</b> .		IoT-1-v4, IoT-1-v6, IoT-11-v4, IoT-11-v6
CR-1.b.1			The network service shall be able to <b>process</b> the MUD URL that is received as an <b>LLDP extension</b> .	IoT-1-v4, IoT-1-v6, IoT-11-v4, IoT-11-v6

Capability Requirement (CR-ID)	Parent Requirement	Subrequirement 1	Subrequirement 2	Test Case
CR-2	The IoT DDoS example implementation shall include the capability for the MUD URL <b>to be provided to a MUD manager.</b>			IoT-1-v4, IoT-1-v6
CR-2.a		The DHCP server shall <b>assign an IP address lease</b> to the MUD-enabled IoT device.		IoT-1-v4, IoT-1-v6
CR-2.a.1			The MUD-enabled IoT device shall <b>receive the IP address.</b>	IoT-1-v4, IoT-1-v6
CR-2.b		<b>The DHCP server shall</b> receive the DHCP message and <b>extract the MUD URL, which is then passed to the MUD manager.</b>		IoT-1-v4, IoT-1-v6
CR-2.b.1			<b>The MUD manager shall receive the MUD URL.</b>	IoT-1-v4, IoT-1-v6
CR-3	The IoT DDoS example implementation shall include a <b>MUD manager that can request a MUD file and signature from a MUD file server.</b>			IoT-1-v4, IoT-1-v6

Capability Requirement (CR-ID)	Parent Requirement	Subrequirement 1	Subrequirement 2	Test Case
CR-3.a		The MUD manager shall use the GET method (RFC 7231) to <b>request MUD and signature files</b> (per RFC 7230) from the MUD file server and can <b>validate the MUD file server's Transport Layer Security (TLS) certificate</b> by using the rules in RFC 2818.		IoT-1-v4, IoT-1-v6
CR-3.a.1			<b>The MUD file server shall receive the https request from the MUD manager.</b>	IoT-1-v4, IoT-1-v6
CR-3.b		<b>The MUD manager</b> shall use the GET method (RFC 7231) to request MUD and signature files (per RFC 7230) from the MUD file server, but it <b>cannot validate the MUD file server's TLS certificate</b> by using the rules in RFC 2818.		IoT-2-v4, IoT-2-v6
CR-3.b.1			<b>The MUD manager shall drop the connection</b> to the MUD file server.	IoT-2-v4, IoT-2-v6

Capability Requirement (CR-ID)	Parent Requirement	Subrequirement 1	Subrequirement 2	Test Case
CR-3.b.2			<b>The MUD manager shall send locally defined policy to the router or switch</b> that handles whether to allow or block traffic to and from the MUD-enabled IoT device.	IoT-2-v4, IoT-2-v6
CR-4	The IoT DDoS example implementation shall include a <b>MUD file server that can serve a MUD file and signature to the MUD manager.</b>			IoT-1-v4, IoT-1-v6
CR-4.a		<b>The MUD file server shall serve the file and signature to the MUD manager, and the MUD manager shall check to determine whether the certificate used to sign the MUD file</b> (signed using distinguished encoding rules [DER]-encoded Cryptographic Message Syntax [CMS] [RFC 5652]) was valid at the time of signing, i.e., the <b>certificate had not expired.</b>		IoT-1-v4, IoT-1-v6

Capability Requirement (CR-ID)	Parent Requirement	Subrequirement 1	Subrequirement 2	Test Case
CR-4.b		The MUD file server shall serve the file and signature to the MUD manager, and the MUD manager shall check to determine whether the certificate used to sign the MUD file was valid at the time of signing, i.e., the certificate had already expired when it was used to sign the MUD file.		IoT-3-v4, IoT-3-v6
CR-4.b.1			The MUD manager shall cease to process the MUD file.	IoT-3-v4, IoT-3-v6
CR-4.b.2			The MUD manager shall send locally defined policy to the router or switch that handles whether to allow or block traffic to and from the MUD-enabled IoT device.	IoT-3-v4, IoT-3-v6
CR-5	The IoT DDoS example implementation shall include a <b>MUD manager</b> that can			IoT-1-v4, IoT-1-v6

Capability Requirement (CR-ID)	Parent Requirement	Subrequirement 1	Subrequirement 2	Test Case
	<b>translate local network configurations based on the MUD file.</b>			
CR-5.a		<b>The MUD manager shall successfully validate the signature of the MUD file.</b>		IoT-1-v4, IoT-1-v6
CR-5.a.1			The MUD manager, after validation of the MUD file signature, shall <b>check for an existing MUD file and translate abstractions in the MUD file to router or switch configurations.</b>	IoT-1-v4, IoT-1-v6
CR-5.a.2			The MUD manager shall <b>cache</b> this newly received MUD file.	IoT-10-v4, IoT-10-v6
CR-5.b		The MUD manager shall attempt to validate the signature of the <b>MUD file</b> , but the <b>signature validation fails</b> (even though the certificate that had been used to create the signature had not been expired at		IoT-4-v4, IoT-4-v6

Capability Requirement (CR-ID)	Parent Requirement	Subrequirement 1	Subrequirement 2	Test Case
		the time of signing, i.e., the signature is invalid for a different reason).		
CR-5.b.1			<b>The MUD manager shall cease processing the MUD file.</b>	IoT-4-v4, IoT-4-v6

			the device's IP address lease has expired.	
CR-11.b.2			<b>The MUD manager should remove all policies</b> associated with the affected IoT device that had been configured on the MUD PEP router/switch.	IoT-8-v4, IoT-8-v6
CR-12	The IoT DDoS example implementation shall include a <b>MUD manager that uses a cached MUD file rather than retrieve a new one if the cache-validity time period has not yet elapsed</b> for the MUD file indicated by the MUD URL. <b>The MUD manager should fetch a new MUD file if the cache-validity time period has already elapsed.</b>			IoT-10-v4, IoT-10-v6
CR-12.a		The MUD manager shall check if the file associated with the <b>MUD URL is present in its cache</b> and shall determine that it is.		IoT-10-v4, IoT-10-v6

Capability Requirement (CR-ID)	Parent Requirement	Subrequirement 1	Subrequirement 2	Test Case
CR-12.a.1			The MUD manager shall <b>check whether the amount of time that has elapsed since the cached file was retrieved is less than or equal to the number of hours in the cache-validity value for this MUD file</b> . If so, the MUD manager shall apply the contents of the cached MUD file.	IoT-10-v4, IoT-10-v6
CR-12.a.2			The MUD manager shall <b>check whether the amount of time that has elapsed since the cached file was retrieved is greater than the number of hours in the cache-validity value for this MUD file</b> . If so, the MUD manager may (but does not have to) fetch a new file by using the MUD URL received.	IoT-10-v4, IoT-10-v6
CR-13	The IoT DDoS example implementation shall ensure that for each rule in a MUD file that pertains to an external domain, the MUD PEP			IoT-9-v4, IoT-9-v6

Capability Requirement (CR-ID)	Parent Requirement	Subrequirement 1	Subrequirement 2	Test Case
	router/switch will get configured with <b>all possible instantiations of that rule</b> , insofar as <b>each instantiation contains one of the IP addresses to which the domain in that MUD file rule may be resolved when queried by the MUD PEP router/switch.</b>			
CR-13.a		The MUD file for a device shall contain a rule involving a <b>domain that can resolve to multiple IP addresses</b> when queried by the MUD PEP router/switch. <b>An access control list (ACL) for permitting access to each of those IP addresses will be inserted into the MUD PEP router/switch</b> for the device in question, and the device will be permitted to communicate with all of those IP addresses.		IoT-9-v4, IoT-9-v6
CR-13.a.1			IPv4 addressing is used on the network.	IoT-9-v4

Capability Requirement (CR-ID)	Parent Requirement	Subrequirement 1	Subrequirement 2	Test Case
CR-13.a.2			IPv6 addressing is used on the network.	IoT-9-v6

## 2.1.2 Test Cases

This section contains the test cases that were used to verify that Build 1 met the requirements listed in Table 2-1.

### 2.1.2.1 Test Case IoT-1-v4

**Table 2-2: Test Case IoT-1-v4**

Test Case Field	Description
Parent Requirements	<p>(CR-1) The IoT DDoS example implementation shall include a mechanism for associating a device with a MUD file URL (e.g., by having the MUD-enabled IoT device emit a MUD file URL via DHCP, Link Layer Discovery Protocol [LLDP], or X.509 or by using some other mechanism to enable the network to associate a device with a MUD file URL).</p> <p>(CR-2) The IoT DDoS example implementation shall include the capability for the MUD URL to be provided to a MUD manager.</p> <p>(CR-3) The IoT DDoS example implementation shall include a MUD manager that can request a MUD file and signature from a MUD file server.</p> <p>(CR-4) The IoT DDoS example implementation shall include a MUD file server that can serve a MUD file and signature to the MUD manager.</p> <p>(CR-5) The IoT DDoS example implementation shall include a MUD manager that can translate local network configurations based on the MUD file.</p> <p>(CR-6) The IoT DDoS example implementation shall include a MUD manager that can configure the router or switch nearest the MUD-enabled IoT device that emitted the URL.</p>

Test Case Field	Description
Testable Requirements	<p>(CR-1.a) Upon initialization, the MUD-enabled IoT device shall broadcast a DHCP message on the network, including at most one MUD URL, in https scheme, within the DHCP transaction.</p> <p>(CR-1.a.1) The DHCP server shall be able to receive DHCPv4 DISCOVER and REQUEST with IANA code 161 (OPTION_MUD_URL_V4) from the MUD-enabled IoT device. (Note: Test IoT-1-v6 does not test this requirement; instead, it tests CR-1.a.2, which pertains to DHCPv6 rather than DHCPv4.)</p> <p>OR</p> <p>(CR-1.b) Upon initialization, the MUD-enabled IoT device shall emit the MUD URL as an LLDP extension.</p> <p>(CR-1.b.1) The network service shall be able to process the MUD URL that is received as an LLDP extension.</p> <p>(CR-2.a) The DHCP server shall assign an IP address lease to the MUD-enabled IoT device.</p> <p>(CR-2.a.1) The MUD-enabled IoT device shall receive the IP address.</p> <p>(CR-2.b) The DHCP server shall receive the DHCP message and extract the MUD URL, which is then passed to the MUD manager.</p> <p>(CR-2.b.1) The MUD manager shall receive the MUD URL.</p> <p>(CR-3.a) The MUD manager shall use the “GET” method (RFC 7231) to request MUD and signature files (per RFC 7230) from the MUD file server and can validate the MUD file server’s TLS certificate by using the rules in RFC 2818.</p> <p>(CR-3.a.1) The MUD file server shall receive the https request from the MUD manager.</p> <p>(CR-4.a) The MUD file server shall serve the file and signature to the MUD manager, and the MUD manager shall check to determine whether the certificate used to sign the MUD file (signed using DER-encoded CMS [RFC 5652]) was valid at the time of signing, i.e., the certificate had not expired.</p> <p>(CR-5.a) The MUD manager shall successfully validate the signature of the MUD file.</p> <p>(CR-5.a.1) The MUD manager, after validation of the MUD file signature, shall check for an existing MUD file and translate abstractions in the MUD file to router or switch configurations.</p>

Test Case Field	Description
	<p>(CR-6.a) The MUD manager shall install a router configuration on the router or switch nearest the MUD-enabled IoT device that emitted the URL.</p> <p>(CR-6.a.1) The router or switch shall have been configured to enforce the route filter sent by the MUD manager.</p>
Description	Shows that, upon connection to the network, a MUD-enabled IoT device used in the IoT DDoS example implementation has its MUD PEP router/switch automatically configured to enforce the route filtering that is described in the device's MUD file, assuming the MUD file has a valid signature and is served from a MUD file server that has a valid TLS certificate
Associated Test Case(s)	N/A
Associated Cybersecurity Framework Subcategory(ies)	ID.AM-1, ID.AM-2, ID.AM-3, PR.DS-5, DE.AE-1, PR.AC-4, PR.AC-5, PR.IP-1, PR.IP-3, PR.PT-3, PR.DS-2
IoT Device(s) Under Test	Raspberry Pi
MUD File(s) Used	<i>ciscopi2.json</i>
Preconditions	<ol style="list-style-type: none"> <li>1. All devices have been configured to use IPv4.</li> <li>2. This MUD file is not currently cached at the MUD manager.</li> <li>3. The device's MUD file has a valid signature that was signed by a certificate that had not yet expired, and it is being hosted on a MUD file server that has a valid TLS certificate.</li> <li>4. The MUD PEP router/switch does not yet have any configuration settings pertaining to the IoT device being used in the test.</li> <li>5. The MUD file for the IoT device being used in the test is identical to the MUD file provided in Section 2.1.3.</li> </ol>

Test Case Field	Description
Procedure	<p>Verify that the MUD PEP router/switch for the IoT device to be used in the test does not yet have any configuration settings installed with respect to the IoT device being used in the test. Also verify that the MUD file of the IoT device to be used is not currently cached at the MUD manager.</p> <p>Power on the IoT device and connect it to the test network. This should set in motion the following series of steps, which should occur automatically:</p> <ol style="list-style-type: none"> <li>1. IoT device automatically emits a MUD URL in one of the following methods: <ol style="list-style-type: none"> <li>a. DHCPv4 message containing the device's MUD URL (IANA code 161) (Note that in the v6 version of this test, IPv6, DHCPv6, and IANA code 112 will be used.)</li> <li>b. LLDP message containing the device's MUD URL in its extension</li> </ol> </li> <li>2. Corresponding service is responsible for the following actions: <ol style="list-style-type: none"> <li>a. The DHCP server receives a DHCP message containing the IoT device's MUD URL.</li> <li>b. The LLDP server receives an LLDP advertisement containing the IoT device's MUD URL.</li> </ol> </li> <li>3. The respective service (LLDP or DHCP) extracts the MUD URL.</li> <li>4. The MUD URL is then provided to the MUD manager.</li> <li>5. The MUD manager automatically contacts the MUD file server that is located using the MUD URL, verifies that it has a valid TLS certificate, requests and receives the MUD file and signature from the MUD file server, validates the MUD file's signature, and translates the MUD file's contents into appropriate route filtering rules. It then installs these rules onto the MUD PEP for the IoT device in question so that this router/switch is now configured to enforce the policies specified in the MUD file.</li> <li>6. The DHCP server offers an IP address lease to the newly connected IoT device.</li> </ol>

Test Case Field	Description
	7. The IoT device requests this IP address lease, which the DHCP server acknowledges.
Expected Results	<p>The MUD PEP router/switch for the IoT device has had its configuration changed, i.e., it has been configured to enforce the policies specified in the IoT device's MUD file. The expected configuration should resemble the following details:</p> <pre>Extended IP access list mud-81726-v4fr.in  10 permit tcp any host 192.168.4.7 eq www ack syn  20 permit tcp any host 192.168.10.104 eq www  30 permit tcp any host 192.168.10.105 eq www  50 permit tcp any 192.168.10.0 0.0.0.255 eq www  60 permit tcp any 192.168.13.0 0.0.0.255 eq www  70 permit tcp any 192.168.14.0 0.0.0.255 eq www  80 permit tcp any eq 22 any  81 permit udp any eq bootpc any eq bootps  82 permit udp any any eq domain  83 deny ip any any</pre> <p>All protocol exchanges described in steps 1–7 above are expected to occur and can be viewed via Wireshark if desired. If the router/switch does not get configured in accordance with the MUD file, each exchange of DHCP and MUD-related protocol traffic should be viewed on the network via Wireshark to determine which transactions did not proceed as expected, and the observed and absent protocol exchanges should be described here.</p>
Actual Results	<p><b><u>Dynamic access-session on switch:</u></b></p> <pre>Build1#sh access-session int g1/0/15 det Interface: GigabitEthernet1/0/15 IIF-ID: 0x1B6BCEA5 MAC Address: b827.ebeb.6c8b IPv6 Address: Unknown IPv4 Address: 192.168.13.9 User-Name: b827eb6c8b Status: Authorized Domain: DATA</pre>

Test Case Field	Description
	<pre> Oper host mode: multi-auth Oper control dir: both Session timeout: N/A Common Session ID: C0A80A02000000A6A9828F06 Acct Session ID: 0x0000003b Handle: 0x2200009c Current Policy: mud-mab-test  Server Policies:     ACS ACL: mud-81726-v4fr.in     Vlan Group: Vlan: 3  Method status list:     Method      State     mab         Authc Success  <b>access-list on switch:</b> Build1#sh access-list mud-81726-v4fr.in Extended IP access list mud-81726-v4fr.in  10 permit tcp any host 192.168.4.7 eq www ack syn  20 permit tcp any host 192.168.10.104 eq www  30 permit tcp any host 192.168.10.105 eq www  50 permit tcp any 192.168.10.0 0.0.0.255 eq www  60 permit tcp any 192.168.13.0 0.0.0.255 eq www  70 permit tcp any 192.168.14.0 0.0.0.255 eq www  80 permit tcp any eq 22 any  81 permit udp any eq bootpc any eq bootps  82 permit udp any any eq domain  83 deny ip any any </pre>
Overall Results	Pass

Test case IoT-1-v6 is identical to test case IoT-1-v4 except that IoT-1-v6 tests requirement CR-1.a.2, whereas IoT-1-v4 tests requirement CR-1.a.1. Hence, as explained above, test case IoT-1-v6 uses IPv6, DHCPv6, and IANA code 112 instead of using IPv4, DHCPv4, and IANA code 161.

#### 2.1.2.2 Test Case IoT-2-v4

**Table 2-3: Test Case IoT-2-v4**

Test Case Field	Description
Parent Requirement	(CR-3) The IoT DDoS example implementation shall include a MUD manager that can request a MUD file and signature from a MUD file server.
Testable requirement	<p>(CR-3.b) The MUD manager shall use the GET method (RFC 7231) to request MUD and signature files (per RFC 7230) from the MUD file server, but it cannot validate the MUD file server's TLS certificate by using the rules in RFC 2818.</p> <p>(CR-3.b.1) The MUD manager shall drop the connection to the MUD file server.</p> <p>(CR-3.b.2) The MUD manager shall send locally defined policy to the router or switch that handles whether to allow or block traffic to and from the MUD-enabled IoT device.</p>
Description	Shows that if a MUD manager is not able to validate the TLS certificate of a MUD file server when trying to retrieve the MUD file for a specific IoT device, the MUD manager will drop the connection to the MUD file server and configure the router/switch according to locally defined policy regarding whether to allow or block traffic to the IoT device in question
Associated Test Case(s)	IoT-11-v4 (for the v6 version of this test, IoT-11-v6)
Associated Cybersecurity Framework Subcategory(ies)	PR.AC-7
IoT Device(s) Under Test	Raspberry Pi
MUD File(s) Used	<i>ciscopi2.json</i>
Preconditions	<ol style="list-style-type: none"> <li>1. All devices have been configured to use IPv4.</li> <li>2. This MUD file is not currently cached at the MUD manager.</li> <li>3. The MUD file server that is hosting the MUD file of the device under test does not have a valid TLS certificate.</li> </ol>

Test Case Field	Description
	<ol style="list-style-type: none"> <li>4. Local policy has been defined to ensure that if the MUD file for a device is located on a server with an invalid certificate, the router/switch will be configured to deny all communication to and from the device.</li> <li>5. The MUD PEP router/switch for the IoT device to be used in the test does not yet have any configuration settings with respect to the IoT device being used in the test.</li> </ol>
Procedure	<p>Verify that the MUD PEP router/switch for the IoT device to be used in the test does not yet have any configuration settings installed with respect to the IoT device being used in the test.</p> <p>Power on the IoT device and connect it to the test network. This should set in motion the following series of steps, which should occur automatically:</p> <ol style="list-style-type: none"> <li>1. The IoT device automatically emits a DHCPv4 message containing the device's MUD URL (IANA code 161). (Note that in the v6 version of this test, IPv6, DHCPv6, and IANA code 112 will be used.)</li> <li>2. The DHCP server receives the DHCP message containing the IoT device's MUD URL.</li> <li>3. The DHCP server offers an IP address lease to the newly connected IoT device.</li> <li>4. The IoT device requests this IP address lease, which the DHCP server acknowledges.</li> <li>5. The DHCP server sends the MUD URL to the MUD manager.</li> <li>6. The MUD manager automatically contacts the MUD file server that is located by using the MUD URL, determines that it does not have a valid TLS certificate, and drops the connection to the MUD file server.</li> <li>7. The MUD manager configures the router/switch that is closest to the IoT device so that it denies all communication to and from the IoT device.</li> </ol>

Test Case Field	Description
Expected Results	The MUD PEP router/switch for the IoT device has had its configuration changed, i.e., it has been configured to local policy for communication to/from the IoT device.
Actual Results	<pre> ***MUDC [STATUS][send_mudfs_request:2005]--&gt; Request URI &lt;https://mudfilesserver/ciscopi2&gt; &lt;/home/mudtester/ca.cert.pem&gt;  *   Trying 192.168.4.5... *   TCP_NODELAY set *   Connected to mudfilesserver (192.168.4.5) port 443 (#0) *   found 1 certificate in /home/mudtester/ca.cert.pem *   found 400 certificates in /etc/ssl/certs *   ALPN, offering http/1.1 *   SSL connection using TLS1.2 / ECDHE_RSA_AES_256_GCM_SHA384 *   server certificate verification failed. Test Case Field	Description
	<pre> ***MUDC [ERROR][send_mudfs_request:2170]--&gt; mudfs_conn failed  Build1#sho access-session int g1018 det       Interface  GigabitEthernet1018       IIF-ID     0x181835C2       MAC Address b827.eba7.0533       IPv6 Address Unknown       IPv4 Address 192.168.10.106       User-Name   b827eba70533       Status      Authorized       Domain      DATA       Oper host mode multi-auth       Oper control dir both       Session timeout NA       Common Session ID C0A80A02000000CCBDB267F8       Acct Session ID 0x00000046       Handle 0x100000c2       Current Policy mud-mab-test  Server Policies  Method status list       Method      State       mab         Authc Success </pre>
Overall Results	Pass

As explained above, test IoT-2-v6 is identical to test IoT-2-v4 except that it uses IPv6, DHCPv6, and IANA code 112 instead of using IPv4, DHCPv4, and IANA code 161.

### 2.1.2.3 Test Case IoT-3-v4

**Table 2-4: Test Case IoT-3-v4**

Test Case Field	Description
Parent Requirement	(CR-4) The IoT DDoS example implementation shall include a MUD file server that can serve a MUD file and signature to the MUD manager.

Test Case Field	Description
Testable Requirement	<p>(CR-4.b) The MUD file server shall serve the file and signature to the MUD manager, and the MUD manager shall check to determine whether the certificate used to sign the MUD file was valid at the time of signing, i.e., the certificate had already expired when it was used to sign the MUD file.</p> <p>(CR-4.b.1) The MUD manager shall cease to process the MUD file.</p> <p>(CR-4.b.2) The MUD manager shall send locally defined policy to the router or switch that handles whether to allow or block traffic to and from the MUD-enabled IoT device.</p>
Description	Shows that if a MUD file server serves a MUD file with a signature that was created with an expired certificate, the MUD manager will cease processing the MUD file
Associated Test Case(s)	IoT-11-v4 (for the v6 version of this test, IoT-11-v6)
Associated Cybersecurity Framework Subcategory(ies)	PR.DS-6
IoT Device(s) Under Test	Raspberry Pi
MUD File(s) Used	<i>expiredcerttest.json</i>
Preconditions	<ol style="list-style-type: none"> <li>1. All devices have been configured to use IPv4.</li> <li>2. This MUD file is not currently cached at the MUD manager.</li> <li>3. The IoT device's MUD file is being hosted on a MUD file server that has a valid TLS certificate, but the MUD file signature was signed by a certificate that had already expired at the time of signature.</li> <li>4. Local policy has been defined to ensure that if the MUD file for a device has a signature that was signed by a certificate that had already expired at the time of signature, the device's MUD PEP router/switch will be configured to deny all communication to/from the device.</li> </ol>

Test Case Field	Description
	<p>5. The MUD PEP router/switch for the IoT device to be used in the test does not yet have any configuration settings with respect to the IoT device being used in the test.</p>
Procedure	<p>Verify that the MUD PEP router/switch for the IoT device to be used in the test does not yet have any configuration settings installed with respect to the IoT device being used in the test.</p> <p>Power on the IoT device and connect it to the test network. This should set in motion the following series of steps, which should occur automatically:</p> <ol style="list-style-type: none"> <li>1. The IoT device automatically emits a DHCPv4 message containing the device's MUD URL (IANA code 161). (Note that in the v6 version of this test, IPv6, DHCPv6, and IANA code 112 will be used.)</li> <li>2. The DHCP server receives the DHCP message containing the IoT device's MUD URL.</li> <li>3. The DHCP server offers an IP address lease to the newly connected IoT device.</li> <li>4. The IoT device requests this IP address lease, which the DHCP server acknowledges.</li> <li>5. The DHCP server sends the MUD URL to the MUD manager.</li> <li>6. The MUD manager automatically contacts the MUD file server that is located by using the MUD URL, verifies that it has a valid TLS certificate, and requests the MUD file and signature from the MUD file server.</li> <li>7. The MUD file server serves the MUD file and signature to the MUD manager, and the MUD manager detects that the MUD file's signature was created by using a certificate that had already expired at the time of signing.</li> <li>8. The MUD manager configures the router/switch that is closest to the IoT device so that it denies all communication to and from the IoT device.</li> </ol>
Expected Results	<p>The MUD PEP router/switch for the IoT device has had its configuration changed, i.e., it has been configured to deny all communication to and</p>

Test Case Field	Description
	<p>from the IoT device. The expected configuration should resemble the details below.</p> <p>Expecting a show access session without a MUD file as seen below:</p> <pre> Build1#show access-session int g1018 det       Interface  GigabitEthernet1018       IIF-ID    0x181835C2       MAC Address  b827.eba7.0533       IPv6 Address  Unknown       IPv4 Address  192.168.10.106       User-Name   b827eba70533       Status     Authorized       Domain     DATA       Oper host mode multi-auth       Oper control dir both       Session timeout NA       Common Session ID C0A80A02000000CCBDB267F8       Acct Session ID 0x00000046       Handle 0x100000c2       Current Policy mud-mab-test  Server Policies  Method status list       Method      State       mab         Authc Success </pre>

Test Case Field	Description
Actual Results	<pre> ***MUDC [INFO][verify_mud_content:1594]--&gt; BIO_reset &lt;1&gt;  ***MUDC [ERROR][verify_mud_content:1604]--&gt; Verification Failure  139713269933824:error:2E099064:CMS routines:cms_sign- erinfo_verify_cert:certificate verify er- ror:../crypto/cms/cms_smime.c:253:Verify error:<b>certificate has expired</b> ***MUDC [INFO][send_mudfs_request:2092]--&gt; Verification failed. Overall Results	Pass

As explained above, test IoT-3-v6 is identical to test IoT-3-v4 except that it uses IPv6, DHCPv6, and IANA code 112 instead of using IPv4, DHCPv4, and IANA code 161.

#### 2.1.2.4 Test Case IoT-4-v4

**Table 2-5: Test Case IoT-4-v4**

Test Case Field	Description
Parent Requirement	(CR-5) The IoT DDoS example implementation shall include a MUD manager that can translate local network configurations based on the MUD file.
Testable Requirement	(CR-5.b) The MUD manager shall attempt to validate the signature of the MUD file, but the signature validation fails (even though the certificate that had been used to create the signature had not been expired at the time of signing, i.e., the signature is invalid for a different reason). (CR-5.b.1) The MUD manager shall cease processing the MUD file. (CR-5.b.2) The MUD manager shall send locally defined policy to the router or switch that handles whether to allow or block traffic to and from the MUD-enabled IoT device.
Description	Shows that if the MUD manager determines that the signature on the MUD file it receives from the MUD file server is invalid, it will cease processing the MUD file and configure the router/switch according to locally defined policy regarding whether to allow or block traffic to the IoT device in question
Associated Test Case(s)	IoT-11-v4 (for the v6 version of this test, IoT-11-v6)
Associated Cybersecurity Framework Subcategory(ies)	PR.DS-6
IoT Device(s) Under Test	Raspberry Pi
MUD File(s) Used	<i>ciscop2.json</i>

Test Case Field	Description
Preconditions	<ol style="list-style-type: none"> <li>1. All devices have been configured to use IPv4.</li> <li>2. This MUD file is not currently cached at the MUD manager.</li> <li>3. Overall Results	Pass

As explained above, test IoT-4-v6 is identical to test IoT-4-v4 except that it uses IPv6, DHCPv6, and IANA code 112 instead of using IPv4, DHCPv4, and IANA code 161.

#### 2.1.2.5 Test Case IoT-5-v4

**Table 2-6: Test Case IoT-5-v4**

Test Case Field	Description
Parent Requirement	<p>(CR-7) The IoT DDoS example implementation shall allow the MUD-enabled IoT device to communicate with approved internet services in the MUD file.</p> <p>(CR-8) The IoT DDoS example implementation shall deny communications from a MUD-enabled IoT device to unapproved internet services (i.e., services that are implicitly denied by virtue of not being explicitly approved).</p>
Testable Requirement	<p>(CR-7.a) The MUD-enabled IoT device shall attempt to initiate outbound traffic to approved internet services.</p> <p>(CR-7.a.1) The router or switch shall receive the attempt and shall allow it to pass based on the filters from the MUD file.</p> <p>(CR-7.b) An approved internet service shall attempt to initiate a connection to the MUD-enabled IoT device.</p> <p>(CR-7.b.1) The router or switch shall receive the attempt and shall allow it to pass based on the filters from the MUD file.</p> <p>(CR-8.a) The MUD-enabled IoT device shall attempt to initiate outbound traffic to unapproved (implicitly denied) internet services.</p> <p>(CR-8.a.1) The router or switch shall receive the attempt and shall deny it based on the filters from the MUD file.</p> <p>(CR-8.b) An unapproved (implicitly denied) internet service shall attempt to initiate a connection to the MUD-enabled IoT device.</p> <p>(CR-8.b.1) The router or switch shall receive the attempt and shall deny it based on the filters from the MUD file.</p> <p>(CR-8.c) The MUD-enabled IoT device shall initiate communications to an internet service that is approved to initiate communications with the MUD-enabled device but not approved to receive communications initiated by the MUD-enabled device.</p> <p>(CR-8.c.1) The router or switch shall receive the attempt and shall deny it based on the filters from the MUD file.</p>

Test Case Field	Description
	<p>(CR-8.d) An internet service shall initiate communications to a MUD-enabled device that is approved to initiate communications with the internet service but that is not approved to receive communications initiated by the internet service.</p> <p>(CR-8.d.1) The router or switch shall receive the attempt and shall deny it based on the filters from the MUD file.</p>
Description	Shows that, upon connection to the network, a MUD-enabled IoT device used in the IoT DDoS example implementation has its MUD PEP router/switch automatically configured to enforce the route filtering that is described in the device's MUD file with respect to communication with internet services. Further shows that the policies that are configured on the MUD PEP router/switch with respect to communication with internet services will be enforced as expected, with communications that are configured as denied being blocked, and communications that are configured as permitted being allowed.
Associated Test Case(s)	IoT-1-v4 (for the v6 version of this test, IoT-1-v6)
Associated Cybersecurity Framework Subcategory(ies)	ID.AM-3, PR.DS-5, PR.IP-1, PR.PT-3
IoT Device(s) Under Test	Raspberry Pi
MUD File(s) Used	<i>ciscopi2.json</i>
Preconditions	<p>Test IoT-1-v4 (or IoT-1-v6) has run successfully, meaning that the MUD PEP router/switch has been configured to enforce the following policies for the IoT device in question (as defined in the MUD file in Section 2.1.3):</p> <ul style="list-style-type: none"> <li>a) Explicitly permit <i>https://yes-permit-from.com</i> to initiate communication with the IoT device.</li> <li>b) Explicitly permit the IoT device to initiate communication with <i>https://yes-permit-to.com</i>.</li> </ul>

Test Case Field	Description
	<p>c) Implicitly deny all other communications with the internet, including denying</p> <ul style="list-style-type: none"> <li>i) the IoT device to initiate communication with <i>https://yes-permit-from.com</i></li> <li>ii) <i>https://yes-permit-to.com</i> to initiate communication with the IoT device</li> <li>iii) communication between the IoT device and all other internet locations, such as <i>https://unnamed-to.com</i> (by not mentioning this or any other URLs in the MUD file)</li> </ul>
Procedure	<p>Note: Procedure steps with strike-through were not tested in this phase because ingress dynamic access control lists (DACLS) are not supported in this implementation.</p> <ol style="list-style-type: none"> <li>1. As stipulated in the preconditions, just before this test, test IoT-1-v4 (or IoT-1-v6) must have been run successfully.</li> <li>2. Initiate communications from the IoT device to <i>https://yes-permit-to.com</i> and verify that this traffic is received at <i>https://yes-permit-to.com</i>. (egress)</li> <li>3. Initiate communications to the IoT device from <i>https://yes-permit-to.com</i> and verify that this traffic is received at the MUD PEP, but it is not forwarded by the MUD PEP, nor is it received at the IoT device. (ingress)</li> <li><del>4. Initiate communications to the IoT device from <i>https://yes-permit-from.com</i> and verify that this traffic is received at the IoT device. (ingress)</del></li> <li><del>5. Initiate communications from the IoT device to <i>https://yes-permit-from.com</i> and verify that this traffic is received at the MUD PEP, but it is not forwarded by the MUD PEP, nor is it received at <i>https://yes-permit-from.com</i>. (ingress)</del></li> <li>6. Initiate communications from the IoT device to <i>https://unnamed.com</i> and verify that this traffic is received at the MUD PEP, but it is not forwarded by the MUD PEP, nor is it received at <i>https://unnamed.com</i>. (egress)</li> </ol>

Test Case Field	Description
	7. Initiate communications to the IoT device from <i>https://unnamed.com</i> and verify that this traffic is received at the MUD PEP, but it is not forwarded by the MUD PEP, nor is it received at the IoT device. (ingress)
Expected Results	Each of the results that is listed as needing to be verified in procedure steps above occurs as expected.
Actual Results	<p><b>Procedure 2:</b> Connection to update server successfully initiated by IoT device:</p> <pre> pi@raspberrypi:~ \$ wget http://www.updateserver.com/ --2018-12-13 21:28:00-- http://www.updateserver.com/ Resolving www.updateserver.com (www.updateserver.com)... 192.168.4.7 Connecting to www.updateserver.com (www.updateserver.com) 192.168.4.7 :80... connected. Test Case Field	Description
	<p>Connecting to 192.168.4.105:80... failed: Connection timed out. Retrying.</p> <hr/> <p><b>Procedure 7:</b>  <b>Unapproved server attempts to connect to IoT device:</b>  [mud@unapprovedserver ~]\$ <b>wget http://192.168.13.14</b>  --2018-12-14 13:03:32-- http://192.168.13.14/  Connecting to 192.168.13.14:80... failed: Connection timed out.  Retrying.</p>
Overall Results	Pass (for testable procedures—as stated, ingress cannot be tested)

As explained above, test IoT-5-v6 is identical to test IoT-5-v4 except that it uses IPv6, DHCPv6, and IANA code 112 instead of using IPv4, DHCPv4, and IANA code 161.

#### 2.1.2.6 Test Case IoT-6-v4

**Table 2-7: Test Case IoT-6-v4**

Test Case Field	Description
Parent Requirement	<p>(CR-9) The IoT DDoS example implementation shall allow the MUD-enabled IoT device to communicate laterally with devices that are approved in the MUD file.</p> <p>(CR-10) The IoT DDoS example implementation shall deny latterly communications from a MUD-enabled IoT device to devices that are not approved in the MUD file (i.e., devices that are implicitly denied by virtue of not being explicitly approved).</p>
Testable Requirement	<p>(CR-9.a) The MUD-enabled IoT device shall attempt to initiate lateral traffic to approved devices.</p> <p>(CR-9.a.1) The router or switch shall receive the attempt and shall allow it to pass based on the filters from the MUD file.</p>

Test Case Field	Description
	<p>(CR-9.b) An approved device shall attempt to initiate a lateral connection to the MUD-enabled IoT device.</p> <p>(CR-9.b.1) The router or switch shall receive the attempt and shall allow it to pass based on the filters from the MUD file.</p> <p>(CR-10.a) The MUD-enabled IoT device shall attempt to initiate lateral traffic to unapproved (implicitly denied) devices.</p> <p>(CR-10.a.1) The router or switch shall receive the attempt and shall deny it based on the filters from the MUD file.</p> <p>(CR-10.b) An unapproved (implicitly denied) device shall attempt to initiate a lateral connection to the MUD-enabled IoT device.</p> <p>(CR-10.b.1) The router or switch shall receive the attempt and shall deny it based on the filters from the MUD file.</p>
Description	Shows that, upon connection to the network, a MUD-enabled IoT device used in the IoT DDoS example implementation has its MUD PEP router/switch automatically configured to enforce the route filtering that is described in the device's MUD file with respect to communication with lateral devices. Further shows that the policies that are configured on the MUD PEP router/switch with respect to communication with lateral devices will be enforced as expected, with communications that are configured as denied being blocked, and communications that are configured as permitted being allowed.
Associated Test Case(s)	IoT-1-v4 (for the v6 version of this test, IoT-1-v6)
Associated Cybersecurity Framework Subcategory(ies)	ID.AM-3, PR.DS-5, PR.AC-5, PR.IP-1, PR.PT-3, PR.IP-3, PR.DS-3
IoT Device(s) Under Test	Raspberry Pi
MUD File(s) Used	<i>ciscopi2.json</i>
Preconditions	Test IoT-1-v4 (or IoT-1-v6) has run successfully, meaning that the MUD PEP router/switch has been configured to enforce the following policies

Test Case Field	Description
	<p>for the IoT device in question with respect to local communications (as defined in the MUD files in Section <a href="#">2.1.3</a>):</p> <ul style="list-style-type: none"> <li>a) Local-network class—Explicitly permit <b>local communication to and from the IoT device and any local hosts</b> (including the specific local hosts <i>anyhost-to</i> and <i>anyhost-from</i>) <b>for specific services</b>, as specified in the MUD file by source port: any; destination port: 80; and protocol: TCP, and which party initiates the connection.</li> <li>b) Manufacturer class—Explicitly permit <b>local communication to and from the IoT device and other classes of IoT devices, as identified by their MUD URL (<i>www.devicetype.com</i>)</b>, and <b>further constrained</b> by source port: any; destination port: 80; and protocol: TCP.</li> <li>c) Same-manufacturer class—Explicitly permit <b>local communication to and from IoT devices of the same manufacturer as the IoT device in question (the domain in the MUD URLs [mudfilesserver] of the other IoT devices is the same as the domain in the MUD URL [mudfilesserver] of the IoT device in question)</b>, and further constrained by source port: any; destination port: 80; and protocol: TCP.</li> <li>d) Implicitly deny all other local communication that is not explicitly permitted in the MUD file, including denying <ul style="list-style-type: none"> <li>i) <b><i>anyhost-to</i> to initiate communications</b> with the IoT device</li> <li>ii) <b>the IoT device to initiate communications</b> with <i>anyhost-to</i> by using a source port, destination port, or protocol (TCP or UDP) that is not explicitly permitted</li> <li>iii) <b>the IoT device to initiate communications with <i>anyhost-from</i></b></li> <li>iv) <b><i>anyhost-from</i> to initiate communications</b> with the IoT device by using a source port, destination port, or protocol (TCP or UDP) that is not explicitly permitted</li> <li>v) communications between the IoT device and all lateral hosts (including <i>unnamed-host</i>) whose <b>MUD URLs are not explicitly mentioned</b> as being permissible in the MUD file</li> </ul> </li> </ul>

Test Case Field	Description
	<ul style="list-style-type: none"> <li>vi) communications between the IoT device and all lateral hosts whose <b>MUD URLs are explicitly mentioned</b> as being permissible, <b>but using a source port, destination port, or protocol (TCP or UDP) that is not explicitly permitted</b></li> <li>vii) communications between the IoT device and all lateral hosts that are <b>not from the same manufacturer</b> as the IoT device in question</li> <li>viii) communications between the IoT device and a lateral host that <b>is from the same manufacturer, but using a source port, destination port, or protocol (TCP or UDP) that is not explicitly permitted</b></li> </ul>
Procedure	<p>Note: Procedure steps with strike-through were not tested in this phase because ingress DACLs are not supported in this implementation.</p> <ol style="list-style-type: none"> <li>1. As stipulated in the preconditions, just before this test, test IoT-1-v4 (or IoT-1-v6) must have been run successfully.</li> <li>2. <del>Local-network (ingress): Initiate communications to the IoT device from <i>anyhost-from</i> for specific permitted service, and verify that this traffic is received at the IoT device.</del></li> <li>3. Local-network (egress): <b>Initiate communications from the IoT device to <i>anyhost-from</i></b> for specific permitted service, and verify that this traffic is received at the MUD PEP, but it <b>is not forwarded</b> by the MUD PEP, nor is it received at <i>anyhost-from</i>.</li> <li>4. Local-network, controller, my-controller, manufacturer class (egress): Initiate communications from the IoT device to <i>anyhost-to</i> <b>for specific permitted service</b>, and verify that this traffic <b>is received</b> at <i>anyhost-to</i>.</li> <li>5. <del>Local-network, controller, my-controller, manufacturer class (ingress): <b>Initiate communications to the IoT device from <i>anyhost-to</i></b> for specific permitted service, and verify that this traffic is received at the MUD PEP, but it <b>is not forwarded</b> by the MUD PEP, nor is it received at the IoT device.</del></li> <li>6. No associated class (egress): Initiate communications from the IoT device to <i>unnamed-host</i> (where <i>unnamed-host</i> is a host that is not</li> </ol>

Test Case Field	Description
	<p>from the same manufacturer as the IoT device in question and whose <b>MUD URL is not explicitly mentioned in the MUD file as being permitted</b>), and verify that this traffic is received at the MUD PEP, but it is <b>not forwarded</b> by the MUD PEP, nor is it received at <i>unnamed-host</i>.</p> <p><del>7. No associated class (ingress): Initiate communications to the IoT device from <i>unnamed-host</i> (where <i>unnamed-host</i> is a host that is not from the same manufacturer as the IoT device in question and whose <b>MUD URL is not explicitly mentioned in the MUD file as being permitted</b>), and verify that this traffic is received at the MUD PEP, but it is not forwarded by the MUD PEP, nor is it received at the IoT device.</del></p> <p>8. Same-manufacturer class (egress): Initiate communications from the IoT device to <i>same-manufacturer-host</i> (where <i>same-manufacturer-host</i> is a host that is from the same manufacturer as the IoT device in question) and verify that this traffic is <b>received</b> at <i>same-manufacturer-host</i>.</p> <p>9. Same-manufacturer class (egress): Initiate communications from the IoT device to <i>same-manufacturer-host</i> (where <i>same-manufacturer-host</i> is a host that is from the same manufacturer as the IoT device in question) <b>but using a port or protocol that is not specified</b>, and verify that this traffic is received at the MUD PEP, but it is <b>not forwarded</b> by the MUD PEP, nor is it received at <i>same-manufacturer-host</i>.</p>
Expected Results	Each of the results that is listed as needing to be verified in the procedure steps above occurs as expected.
Actual Results	<p>The numbering in this section correlates with the procedure steps above:</p> <p>3. Overall Results	Pass (for testable procedures—as stated, ingress cannot be tested)

As explained above, test IoT-6-v6 is identical to test IoT-6-v4 except that it uses IPv6, DHCPv6, and IANA code 112 instead of using IPv4, DHCPv4, and IANA code 161.

#### 2.1.2.7 Test Case IoT-7-v4

**Table 2-8: Test Case IoT-7-v4**

Test Case Field	Description
Parent Requirement	(CR-11) If the IoT DDoS example implementation is such that its DHCP server does not act as a MUD manager and it forwards a MUD URL to a MUD manager, the DHCP server must notify the MUD manager of any corresponding change to the DHCP state of the MUD-enabled IoT device, and the MUD manager should remove the implemented policy configuration in the router/switch pertaining to that MUD-enabled IoT device.
Testable Requirement	<p>(CR-11.a) The MUD-enabled IoT device shall explicitly release the IP address lease (i.e., it sends a DHCP release message to the DHCP server).</p> <p>(CR-11.a.1) The DHCP server shall notify the MUD manager that the device's IP address lease has been released.</p> <p>(CR-11.a.2) The MUD manager should remove all policies associated with the disconnected IoT device that had been configured on the MUD PEP router/switch.</p>

Test Case Field	Description
Description	Shows that when a MUD-enabled IoT device explicitly releases its IP address lease, the MUD-related configuration for that IoT device will be removed from its MUD PEP router/switch
Associated Test Case(s)	IoT-1-v4 (or IoT-1-v6 when IPv6 addressing is used)
Associated Cybersecurity Framework Subcategory(ies)	PR.IP-3, PR.DS-3
IoT Device(s) Under Test	Raspberry Pi
MUD File(s) Used	<i>ciscopi2.json</i>
Preconditions	Test IoT-1-v4 (or IoT-1-v6) has run successfully, meaning that the MUD PEP router/switch has been configured to enforce the policies defined in the MUD file in Section 2.1.3 for the IoT device in question.
Procedure	<ol style="list-style-type: none"> <li>1. As stipulated in the preconditions, just before this test, test IoT-1-v4 (or IoT-1-v6) must have been run successfully. Verify that the MUD PEP router/switch for the IoT device has been configured to enforce the policies listed in the preconditions section above for the IoT device in question.</li> <li>2. Cause a DHCP release of the IoT device in question.</li> <li>3. Verify that all the configuration rules listed above have been removed from the MUD PEP router/switch for the IoT device in question.</li> </ol>
Expected Results	All of the configuration rules listed above have been removed from the MUD PEP router/switch for the IoT device in question.
Actual Results	<p>Procedure 1:</p> <pre>Build1#sh access-session int g1/0/15 det       Interface: GigabitEthernet1/0/15       IIF-ID: 0x1B6BCEA5       MAC Address: b827.ebeb.6c8b</pre>

As explained above, test IoT-7-v6 is identical to test IoT-7-v4 except that it uses IPv6, DHCPv6, and IANA code 112 instead of using IPv4, DHCPv4, and IANA code 161.

#### 2.1.2.8 Test Case IoT-8-v4

**Table 2-9: Test Case IoT-8-v4**

Test Case Field	Description
Parent Requirement	(CR-11) If the IoT DDoS example implementation is such that its DHCP server does not act as a MUD manager and it forwards a MUD URL to a MUD manager, the DHCP server must notify the MUD manager of any corresponding change to the DHCP state of the MUD-enabled IoT device, and the MUD manager should remove the implemented policy configuration in the router/switch pertaining to that MUD-enabled IoT device.
Testable Requirement	(CR-11.b) The MUD-enabled IoT device's IP address lease shall expire. (CR-11.b.1) The DHCP server shall notify the MUD manager that the device's IP address lease has expired.

Test Case Field	Description
	(CR-11.b.2) The MUD manager should remove all policies associated with the affected IoT device that had been configured on the MUD PEP router/switch.
Description	Shows that when a MUD-enabled IoT device's IP address lease expires, the MUD-related configuration for that IoT device will be removed from its MUD PEP router/switch
Associated Test Case(s)	IoT-1-v4 (or IoT-1-v6 when IPv6 addressing is used)
Associated Cybersecurity Framework Subcategory(ies)	PR.IP-3, PR.DS-3
IoT Device(s) Under Test	TBD (Not testable in Build 1)
MUD File(s) Used	TBD (Not testable in Build 1)
Preconditions	Test IoT-1-v4 (or IoT-1-v6) has run successfully, meaning that the MUD PEP router/switch has been configured to enforce the policies defined in the MUD file in Section 2.1.3 for the IoT device in question.
Procedure	<ol style="list-style-type: none"> <li>1. Configure the DHCP server to have a DHCP lease time of 10 minutes.</li> <li>2. Run test IoT-1-v4 (or IoT-1-v6).</li> <li>3. Verify that the MUD PEP router/switch for the IoT device has been configured to enforce the policies listed above for the IoT device in question.</li> <li>4. Disconnect the IoT device in question from the network.</li> <li>5. After 10 minutes have elapsed, verify that all of the configuration rules listed above have been removed from the MUD PEP router/switch for the IoT device in question.</li> </ol>
Expected Results	Once 10 minutes have elapsed after disconnecting the IoT device from the network, all of the configuration rules listed above have been removed from the MUD PEP router/switch for the IoT device in question.

Test Case Field	Description
Actual Results	TBD (Not testable in Build 1)
Overall Results	TBD (Not testable in Build 1)

As explained above, test IoT-8-v6 is identical to test IoT-8-v4 except that it uses IPv6, DHCPv6, and IANA code 112 instead of using IPv4, DHCPv4, and IANA code 161.

#### 2.1.2.9 Test Case IoT-9-v4

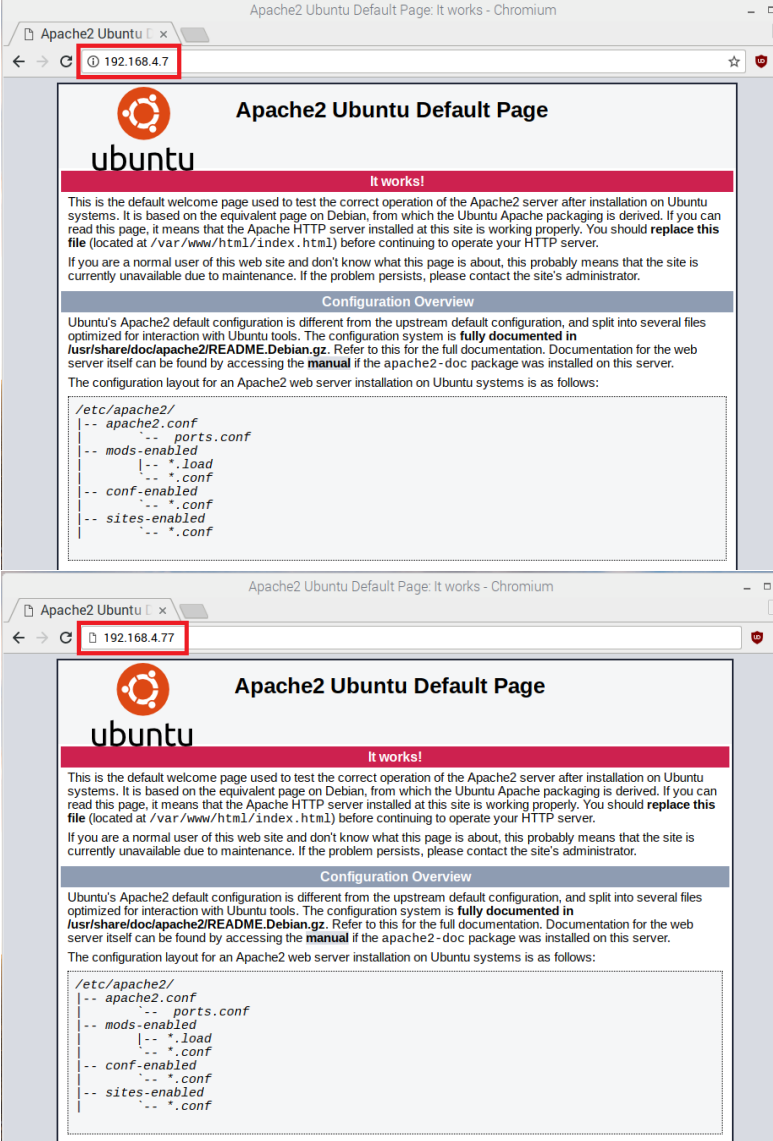

**Table 2-10: Test Case IoT-9-v4**

Test Case Field	Description
Parent Requirements	(CR-13) The IoT DDoS example implementation shall ensure that for each rule in a MUD file that pertains to an external domain, the MUD PEP router/switch will get configured with all possible instantiations of that rule, insofar as each instantiation contains one of the IP addresses to which the domain in that MUD file rule may be resolved when queried by the MUD PEP router/switch.
Testable Requirements	(CR-13.a) The MUD file for a device shall contain a rule involving an external domain that can resolve to multiple IP addresses when queried by the MUD PEP router/switch. An ACL for permitting access to each of those IP addresses will be inserted into the MUD PEP router/switch for the device in question, and the device will be permitted to communicate with all of those IP addresses.
Description	Shows that if a domain in a MUD file rule resolves to multiple IP addresses when the address resolution is queried by the network gateway, then <ol style="list-style-type: none"> <li>1. ACLs instantiating that MUD file rule corresponding to each of these IP addresses will be configured in the gateway for the IoT device associated with the MUD file, and</li> </ol>

Test Case Field	Description
	2. the IoT device associated with the MUD file will be permitted to communicate with all of the IP addresses to which that domain resolves
Associated Test Case(s)	N/A
Associated Cybersecurity Framework Subcategory(ies)	ID.AM-1, ID.AM-2, ID.AM-3, PR.DS-5, DE.AE-1, PR.AC-4, PR.AC-5, PR.IP-1, PR.IP-3, PR.DS-2
IoT Device(s) Under Test	Raspberry Pi
MUD File(s) Used	<i>dnstest.json</i>
Preconditions	<ol style="list-style-type: none"> <li>1. The MUD PEP router/switch does not yet have any configuration settings pertaining to the IoT device being used in the test.</li> <li>2. The MUD file for the IoT device being used in the test is identical to the MUD file provided in Section 2.1.3. (Therefore, the MUD file used in the test permits the device to send data to <i>www.updateserver.com</i>.)</li> <li>3. The tester has access to a domain name system (DNS) server that will be used by the MUD PEP router/switch and can configure it such that it will resolve the domain <i>www.updateserver.com</i> to any of these addresses when queried by the MUD PEP router/switch: x1.x1.x1.x1, y1.y1.y1.y1, and z1.z1.z1.z1.</li> <li>4. There is an update server running at each of these three IP addresses.</li> </ol>

Test Case Field	Description
Procedure	<ol style="list-style-type: none"> <li>1. Verify that the MUD PEP router/switch for the IoT device to be used in the test does not yet have any configuration settings installed with respect to the IoT device being used in the test.</li> <li>2. Run test IoT-1-v4 (or IoT-1-v6). The result should be that the MUD PEP router/switch has been configured to explicitly permit the IoT device to initiate communication with <i>www.update server.com</i>.</li> <li>3. Verify that the MUD PEP router/switch has been configured with ACLs that permit the IoT device to send data to IP addresses x1.x1.x1.x1, y1.y1.y1.y1, and z1.z1.z1.z1.</li> <li>4. Have the device in question attempt to connect to x1.x1.x1.x1, y1.y1.y1.y1, and z1.z1.z1.z1.</li> </ol>
Expected Results	<p>The MUD PEP router/switch for the IoT device has had its configuration changed, i.e., it has been configured to permit the IoT device to send data to IP addresses x1.x1.x1.x1, y1.y1.y1.y1, and z1.z1.z1.z1.</p> <p>The IoT device is permitted to send data to each of the update servers at these addresses.</p>
Actual Results	<p><b>Procedures 1–2:</b>  <b>Completed; excluded for brevity</b></p> <p><b>Procedure 3:</b>  <b>MUD MANAGER:</b></p> <pre> ***MUDC [INFO][fetch_uri_from_macaddr:2166]--&gt; ===== Returning URI:https://mudfiles server/dnstest.json  ***MUDC [INFO][handle_get_aclname:3149]--&gt; Found URI https://mudfiles server/dnstest.json for MAC address b827ebcf7b81  ***MUDC [INFO][validate_muduri:3009]--&gt; uri: https://mudfiles server/dnstest.jsonhttps://mudfiles server/dnst est.json  ***MUDC [INFO][validate_muduri:3035]--&gt; ip: mudfiles server, filename: dnstest.json  ***MUDC [INFO][handle_get_aclname:3194]--&gt; Got URL from message &lt;https://mudfiles server/dnstest.json&gt; </pre>

Test Case Field	Description

Test Case Field	Description
	<pre> 41 permit udp any eq bootpc any eq bootps 42 permit udp any any eq domain 43 deny ip any any </pre> <p><b>Procedure 4:</b></p>  <p>The screenshots show the Apache2 Ubuntu Default Page in a Chromium browser. The address bar in both shows a local IP address (192.168.4.7 and 192.168.4.77). The page content includes the Ubuntu logo, the title 'Apache2 Ubuntu Default Page', and a red banner that says 'It works!'. Below this, there is a paragraph explaining that this is the default welcome page used to test the correct operation of the Apache2 server after installation on Ubuntu systems. It also mentions that if you can read this page, it means that the Apache HTTP server installed at this site is working properly. You should replace this file (located at /var/www/html/index.html) before continuing to operate your HTTP server. Below this, there is a section titled 'Configuration Overview' which explains that Ubuntu's Apache2 default configuration is different from the upstream default configuration, and split into several files optimized for interaction with Ubuntu tools. The configuration system is fully documented in /usr/share/doc/apache2/README.Debian.gz. Refer to this for the full documentation. Documentation for the web server itself can be found by accessing the manual if the apache2-doc package was installed on this server. The configuration layout for an Apache2 web server installation on Ubuntu systems is as follows:</p> <pre> /etc/apache2/  -- apache2.conf      -- ports.conf      -- mods-enabled          -- *.load          -- *.conf      -- conf-enabled          -- *.conf      -- sites-enabled          -- *.conf </pre>

Test Case Field	Description
Overall Results	Pass

Test Case IoT-9-v6 is identical to test case IoT-9-v4 except that IoT-9-v6 uses IPv6 addresses rather than IPv4 addresses.

#### 2.1.2.10 Test Case IoT-10-v4

**Table 2-11: Test Case IoT-10-v4**

Test Case Field	Description
Parent Requirements	(CR-12) The IoT DDoS example implementation shall include a MUD manager that uses a cached MUD file rather than retrieve a new one if the cache-validity time period has not yet elapsed for the MUD file indicated by the MUD URL. The MUD manager should fetch a new MUD file if the cache-validity time period has already elapsed.
Testable Requirements	<p>(CR-12.a) The MUD manager shall check if the file associated with the MUD URL is present in its cache and shall determine that it is.</p> <p>(CR-12.a.1) The MUD manager shall check whether the amount of time that has elapsed since the cached file was retrieved is less than or equal to the number of hours in the cache-validity value for this MUD file. If so, the MUD manager shall apply the contents of the cached MUD file.</p> <p>(CR-12.a.2) The MUD manager shall check whether the amount of time that has elapsed since the cached file was retrieved is greater than the number of hours in the cache-validity value for this MUD file. If so, the MUD manager may (but does not have to) fetch a new file by using the MUD URL received.</p>
Description	Shows that, upon connection to the network, a MUD-enabled IoT device used in the IoT DDoS example implementation has its MUD PEP router/switch automatically configured to enforce the route filtering that is described in the cached MUD file for that device's MUD URL, assuming that the amount of time that has elapsed since the cached MUD

Test Case Field	Description
	file was retrieved is less than or equal to the number of hours in the file's cache-validity value. If the cache validity has expired for the respective file, the MUD manager should fetch a new MUD file from the MUD file server.
Associated Test Case(s)	N/A
Associated Cybersecurity Framework Subcategory(ies)	ID.AM-1, ID.AM-2, ID.AM-3, PR.DS-5, DE.AE-1, PR.AC-4, PR.AC-5, PR.IP-1, PR.IP-3, PR.DS-2, PR.PT-3
IoT Device(s) Under Test	Raspberry Pi
MUD File(s) Used	<i>Ciscopi2.json</i>
Preconditions	<ol style="list-style-type: none"> <li>1. All devices have been configured to use IPv4.</li> <li>2. The MUD PEP router/switch does not yet have any configuration settings pertaining to the IoT device being used in the test.</li> <li>3. The MUD file for the IoT device being used in the test is identical to the MUD file provided in Section 2.1.3.</li> </ol>
Procedure	<p>Verify that the MUD PEP router/switch for the IoT device to be used in the test does not yet have any configuration settings installed with respect to the IoT device being used in the test.</p> <ol style="list-style-type: none"> <li>1. Run test IoT-1-v4 (or IoT-1-v6).</li> <li>2. Within 24 hours (i.e., within the cache-validity period for the MUD file) of running test IoT-1-v4 (or IoT-1-v6), remove the IoT device that was connected during test IoT-1-v4 (or IoT-1-v6) from the network. Ensure all traffic filters associated to IoT device have been removed, and reconnect it to the test network. This should set in motion the following series of steps, which should occur automatically.</li> <li>3. The IoT device automatically emits a DHCPv4 message containing the device's MUD URL (IANA code 161). (Note that in the v6 version of this test, IPv6, DHCPv6, and IANA code 112 will be used.)</li> </ol>

Test Case Field	Description
	<ol style="list-style-type: none"> <li>4. The DHCP server receives the DHCPv4 message containing the IoT device's MUD URL.</li> <li>5. The DHCP server offers an IP address lease to the newly connected IoT device.</li> <li>6. The IoT device requests this IP address lease, which the DHCP server acknowledges.</li> <li>7. The DHCP server sends the MUD URL to the MUD manager.</li> <li>8. The MUD manager determines that it has this MUD file cached and checks that the amount of time that has elapsed since the cached file was retrieved is less than or equal to the number of hours in the cache-validity value for this MUD file. If the cache validity has been exceeded, the MUD manager will fetch a new MUD file. (Run the test both ways—with a cache-validity period that has expired and with one that has not.)</li> <li>9. The MUD manager translates the MUD file's contents into appropriate route filtering rules and installs these rules onto the MUD PEP for the IoT device in question so that this router/switch is now configured to enforce the policies specified in the MUD file.</li> </ol>
Expected Results	<p>The MUD PEP router/switch for the IoT device has had its configuration changed, i.e., it has been configured to enforce the policies specified in the IoT device's MUD file. The expected configuration should resemble the following.</p> <p><b>Cache is valid</b> (the MUD manager does NOT retrieve the MUD file from the MUD file server):</p> <pre>Extended IP access list mud-81726-v4fr.in  10 permit tcp any host 192.168.4.7 eq www ack syn  20 permit tcp any host 192.168.10.104 eq www  30 permit tcp any host 192.168.10.105 eq www  50 permit tcp any 192.168.10.0 0.0.0.255 eq www  60 permit tcp any 192.168.13.0 0.0.0.255 eq www  70 permit tcp any 192.168.14.0 0.0.0.255 eq www  80 permit tcp any eq 22 any  81 permit udp any eq bootpc any eq bootps  82 permit udp any any eq domain  83 deny ip any any</pre>

Test Case Field	Description
	<p><b>Cache is valid (the MUD manager does NOT retrieve the MUD file from the MUD file server):</b></p> <pre>Extended IP access list mud-81726-v4fr.in  10 permit tcp any host 192.168.4.7 eq www ack syn  20 permit tcp any host 192.168.10.104 eq www  30 permit tcp any host 192.168.10.105 eq www  50 permit tcp any 192.168.10.0 0.0.0.255 eq www  60 permit tcp any 192.168.13.0 0.0.0.255 eq www  70 permit tcp any 192.168.14.0 0.0.0.255 eq www  80 permit tcp any eq 22 any  81 permit udp any eq bootpc any eq bootps  82 permit udp any any eq domain  83 deny ip any any</pre> <p><b>Cache is not valid (the MUD manager does retrieve the MUD file from the MUD file server):</b></p> <pre>Extended IP access list mud-81726-v4fr.in  10 permit tcp any host 192.168.4.7 eq www ack syn  20 permit tcp any host 192.168.10.104 eq www  30 permit tcp any host 192.168.10.105 eq www  50 permit tcp any 192.168.10.0 0.0.0.255 eq www  60 permit tcp any 192.168.13.0 0.0.0.255 eq www  70 permit tcp any 192.168.14.0 0.0.0.255 eq www  80 permit tcp any eq 22 any  81 permit udp any eq bootpc any eq bootps  82 permit udp any any eq domain  83 deny ip any any</pre> <p>All protocol exchanges described in steps 1–9 above are expected to occur and can be viewed via Wireshark if desired. If the router/switch does not get configured in accordance with the MUD file, each exchange of DHCP and MUD-related protocol traffic should be viewed on the network via Wireshark to determine which transactions did not proceed as expected, and the observed and absent protocol exchanges should be described here.</p>

Test case IoT-10-v6 is identical to test case IoT-10-v4 except that IoT-10-v6 tests requirement CR-1.a.2, whereas IoT-10-v4 tests requirement CR-1.a.1. Hence, as explained above, test IoT-10-v6 uses IPv6, DHCPv6, and IANA code 112 instead of using IPv4, DHCPv4, and IANA code 161.

#### 2.1.2.11 Test Case IoT-11-v4

**Table 2-12: Test Case IoT-11-v4**

Test Case Field	Description
Parent Requirements	(CR-1) The IoT DDoS example implementation shall include a mechanism for associating a device with a MUD file URL (e.g., by having the MUD-enabled IoT device emit a MUD file URL via DHCP, Link Layer Discovery Protocol [LLDP], or X.509 or by using some other mechanism to enable the network to associate a device with a MUD file URL).

Test Case Field	Description
Testable Requirements	<p>(CR-1.a) Upon initialization, the MUD-enabled IoT device shall broadcast a DHCP message on the network, including at most one MUD URL, in https scheme, within the DHCP transaction.</p> <p>(CR-1.a.1) The DHCP server shall be able to receive DHCPv4 DISCOVER and REQUEST with IANA code 161 (OPTION_MUD_URL_V4) from the MUD-enabled IoT device.</p> <p>OR</p> <p>(CR-1.b) Upon initialization, the MUD-enabled IoT device shall emit the MUD URL as an LLDP extension.</p> <p>(CR-1.b.1) The network service shall be able to process the MUD URL that is received as an LLDP extension.</p>
Description	Shows that the IoT DDoS example implementation includes IoT devices that can emit a MUD URL via DHCP or LLDP
Associated Test Case(s)	N/A
Associated Cybersecurity Framework Subcategory(ies)	ID.AM-1
IoT Device(s) Under Test	Raspberry Pi, Molex light engine, u-blox C027-G35
MUD File(s) Used	<i>Ciscopi2.json, molex.json, ublox.json</i>
Preconditions	Device has been developed to emit a MUD URL in a DHCP transaction
Procedure	<ol style="list-style-type: none"> <li>1. Power on a device and connect it to the network.</li> <li>2. Verify that the device emits a MUD URL in a DHCP transaction or LLDP message. <ol style="list-style-type: none"> <li>a. Use Wireshark to capture a DHCP transaction with options present.</li> </ol> </li> </ol>

Test Case Field	Description
	b. Use Wireshark to capture an LLDP message with a MUD URL present in the LLDP frame.
Expected Results	DHCP transaction with MUD option 161 or LLDP TLV MUD extension enabled and MUD URL included
Actual Results	<p><b>Raspberry Pi (using DHCPv4):</b></p> <pre> 2875 2931.939031... 0.0.0.0          255.255.255.255    DHCP      350 DHCP Discover - Transaction I 2877 2933.217946... 0.0.0.0          255.255.255.255    DHCP      350 DHCP Request - Transaction I 3174 3005.512734... 0.0.0.0          255.255.255.255    DHCP      350 DHCP Discover - Transaction I 3175 3005.513333... 0.0.0.0          255.255.255.255    DHCP      350 DHCP Request - Transaction I                 </pre> <p>Frame 2875: 350 bytes on wire (2800 bits), 350 bytes captured (2800 bits) on interface 0  Ethernet II, Src: Raspberri_eb:6c:8b (b8:27:eb:eb:6c:8b), Dst: Broadcast (ff:ff:ff:ff:ff:ff)  Internet Protocol Version 4, Src: 0.0.0.0, Dst: 255.255.255.255  User Datagram Protocol, Src Port: 68, Dst Port: 67  Dynamic Host Configuration Protocol (Discover)</p> <ul style="list-style-type: none"> <li>Message type: Boot Request (1) <ul style="list-style-type: none"> <li>Hardware type: Ethernet (0x01)</li> <li>Hardware address length: 6</li> <li>Hops: 0</li> <li>Transaction ID: 0x02523497</li> <li>Seconds elapsed: 0</li> <li>&gt; Bootp flags: 0x0000 (Unicast) <ul style="list-style-type: none"> <li>Client IP address: 0.0.0.0</li> <li>Your (client) IP address: 0.0.0.0</li> <li>Next server IP address: 0.0.0.0</li> <li>Relay agent IP address: 0.0.0.0</li> <li>Client MAC address: Raspberri_eb:6c:8b (b8:27:eb:eb:6c:8b)</li> <li>Client hardware address padding: 000000000000000000000000</li> <li>Server host name not given</li> <li>Boot file name not given</li> <li>Magic cookie: DHCP</li> <li>&gt; Option: (53) DHCP Message Type (Discover)</li> <li>&gt; Option: (57) Maximum DHCP Message Size</li> <li>&gt; Option: (55) Parameter Request List <ul style="list-style-type: none"> <li>✓ Option: (161) Manufacturer Usage Description <ul style="list-style-type: none"> <li>Length: 30</li> <li>MUDURL: https://mudfileserver/ciscopi2</li> </ul> </li> </ul> </li> <li>&gt; Option: (255) End <ul style="list-style-type: none"> <li>Padding: 000</li> </ul> </li> </ul> </li> </ul> </li> </ul> <p><b>u-blox C027-G35 (using DHCPv4):</b></p>

## 2.2 Demonstration of Non-MUD-Related Capabilities

In addition to supporting MUD, Build 1 supports capabilities with respect to device discovery, attribute identification, and monitoring. Table 2-13 lists the non-MUD-related capabilities that were demonstrated for Build 1. We use the letter “C” as a prefix for these functional capability identifiers in the table below because these capabilities are specific to Build 1, which uses Cisco equipment.

## 2.2.1 Non-MUD-Related Functional Capabilities

Table 2-13: Non-MUD-Related Functional Capabilities Demonstrated

Functional Capability	Parent Capability	Subrequirement 1	Subrequirement 2	Exercise ID
C-1	The IoT DDoS example implementation shall include a visibility component that can <b>detect, identify, categorize, and monitor the status of IoT devices</b> that are on the network.			CnMUD-13-v4, CnMUD-13-v6
C-1.a		The visibility component shall <b>detect and identify</b> the attributes and category of a newly connected IoT device.		CnMUD-13-v4, IoT-13-v6
C-1.a.1			The visibility component shall <b>monitor the status</b> of the IoT device (e.g., notice if the device goes off-line).	CnMUD-13-v4, IoT-13-v6

## 2.2.2 Exercises to Demonstrate the Above Non-MUD-Related Capabilities

This section contains the exercises that were performed to verify that Build 1 supports the non-MUD-related capabilities listed in Table 2-13.

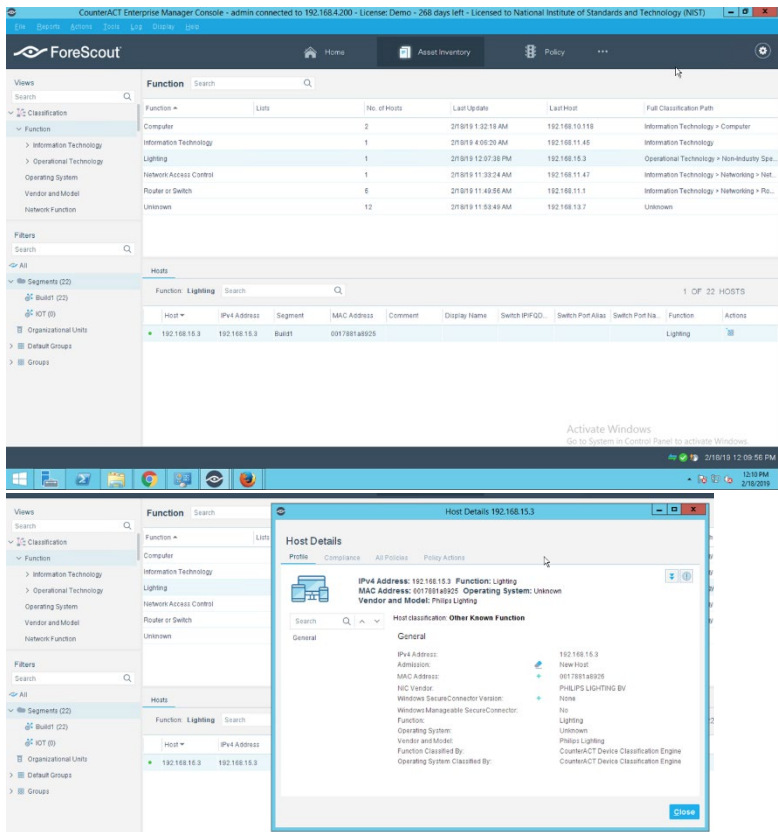

### 2.2.2.1 Exercise CnMUD-13-v4

**Table 2-14: Exercise CnMUD-13-v4**

Test Case Field	Description
Parent Requirements	(C-1) The IoT DDoS example implementation shall include a visibility component that can detect, identify, categorize, and monitor the status of IoT devices that are on the network.
Testable Requirements	(C-1.a) The visibility component shall detect and identify the attributes and category of a newly connected IoT device. (C-1.a.1) The visibility component shall monitor the status of the IoT device (e.g., notice if the device goes offline).
Description	Shows that the IoT DDoS example implementation includes a visibility component that can perform the following actions. Upon connection of a live IoT device to the network, the device will be detected; identified in terms of attributes such as its IP address, operating system (OS), and device type; and continuously monitored as long as it remains live on the network. If the device becomes disconnected or turns off, this change of status will also be detected.
Associated Test Case(s)	N/A
Associated Cybersecurity Framework Subcategory(ies)	ID.AM-1, ID.AM-2, ID.AM-3, DE.AE-1, DE.CM-1
IoT Device(s) Under Test	Raspberry Pi
MUD File(s) Used	Not applicable for this test
Preconditions	The visibility component is up and running and attached to the network.

Test Case Field	Description
Procedure	<ol style="list-style-type: none"> <li>1. Power on a device and connect it to the network.</li> <li>2. Verify that the device is detected by the visibility component and that its type, address, OS, and other features are identified, and the device is categorized correctly.</li> <li>3. Turn off the device.</li> <li>4. Verify that its absence from the network is detected.</li> <li>5. Power the device back on.</li> <li>6. Verify that its presence is detected and its features are identified correctly.</li> <li>7. Disconnect the device from the network.</li> <li>8. Verify that its absence from the network is detected.</li> </ol>
Expected Results	All expectations as enumerated in items 2, 4, 6, and 8 above are observed.
Actual Results	<p><b>At Power-On:</b></p> <pre> pi@raspberrypi:~ \$ ifconfig eth0: flags=4163&lt;UP,BROADCAST,RUNNING,MULTICAST&gt;  mtu 1500       inet 192.168.10.101  netmask 255.255.255.0  broadcast 192.168.10.255       ether b8:27:eb:eb:6c:8b  txqueuelen 1000  (Ethernet)       RX packets 9193  bytes 8208593 (7.8 MiB)       RX errors 0  dropped 5  overruns 0  frame 0       TX packets 7210  bytes 822414 (803.1 KiB)       TX errors 0  dropped 0 overruns 0  carrier 0  colli- sions 0  lo: flags=73&lt;UP,LOOPBACK,RUNNING&gt;  mtu 65536       inet 127.0.0.1  netmask 255.0.0.0       inet6 ::1  prefixlen 128  scopeid 0x10&lt;host&gt;       loop txqueuelen 1000  (Local Loopback)       RX packets 16  bytes 1467 (1.4 KiB)       RX errors 0  dropped 0  overruns 0  frame 0       TX packets 16  bytes 1467 (1.4 KiB)       TX errors 0  dropped 0 overruns 0  carrier 0  colli- sions 0 </pre> <p><b>Screenshot from Forescout:</b> IoT device status is indicated by green or gray light shown in the screen capture</p>

Test Case Field	Description
	 <p>The screenshot displays the ForeScout CounterACT Enterprise Manager Console. The top navigation bar includes links for Home, Asset Inventory, Policy, and a user profile. The main interface is divided into a left sidebar with navigation options like Views, Search, Classification, Function, and Filters, and a central content area. The 'Function' tab is selected, showing a table of hosts with columns for Function, No. of Hosts, Last Update, Last Host, and Full Classification Path. A table with 5 rows is visible, listing various functions like Computer, Information Technology, Lighting, Network Access Control, and Router or Switch. Below this, the 'Hosts' tab is selected, showing a table of hosts with columns for Host, IPv4 Address, Segment, MAC Address, Comment, Display Name, Switch (IPFQ), Switch Port Alias, Switch Port ID, Function, and Actions. A table with 1 row is visible, showing a host with IPv4 Address 192.168.15.3 and Function Lighting. A 'Host Details' window is open, showing details for the host 192.168.15.3, including its IP Address, MAC Address, Operating System, Vendor and Model, and Host Classification.</p>
Overall Results	Pass

Test case CnMUD-13-v6 is identical to test case CnMUD-13-v4 except that test case CnMUD-13-v6 uses IPv6 and DHCPv6 instead of using IPv4 and DHCPv4.

## 3 Build 2

Build 2 uses equipment from MasterPeace Solutions Ltd., GCA, and ThreatSTOP. The MasterPeace Solutions Yikes! router, cloud service, and mobile application are used to support MUD as well as to perform device discovery on the network and to apply additional traffic rules to both MUD-capable and non-MUD-capable devices based on device manufacturer and model. The GCA Quad9 DNS Service and the ThreatSTOP Threat MUD File Server are used to support threat signaling.

### 3.1 Evaluation of MUD-Related Capabilities

The functional evaluation that was conducted to verify that Build 2 conforms to the MUD specification was based on the Build 2-specific requirements listed in Table 3-1.

#### 3.1.1 Requirements

Table 3-1: MUD Use Case Functional Requirements

Capability Requirement (CR-ID)	Parent Requirement	Subrequirement 1	Subrequirement 2	Test Case
CR-1	The IoT DDoS example implementation shall include a mechanism for associating a device with a MUD file URL (e.g., by having the MUD-enabled <b>IoT device emit a MUD file URL via DHCP, LLDP, or X.509 or by using some other mechanism to enable the network to associate a device with a MUD file URL</b> ).			IoT-1-v4, IoT-1-v6, IoT-11-v4, IoT-11-v6
CR-1.a		Upon initialization, the MUD-enabled IoT device shall broadcast a DHCP message on the network, including at most one		IoT-1-v4, IoT-1-v6, IoT-11-v4, IoT-11-v6

Capability Requirement (CR-ID)	Parent Requirement	Subrequirement 1	Subrequirement 2	Test Case
		<b>MUD URL, in https scheme, within the DHCP transaction.</b>		
CR-1.a.1			The DHCP server shall be able to receive <b>DHCPv4 DISCOVER and REQUEST with IANA code 161</b> (OPTION_MUD_URL_V4) from the MUD-enabled IoT device.	IoT-1-v4, IoT-11-v4
CR-1.a.2			The DHCP server shall be able to receive <b>DHCPv6 Solicit and Request with IANA code 112</b> (OPTION_MUD_URL_V6) from the MUD-enabled IoT device.	IoT-1-v6, IoT-11-v6
CR-2	The IoT DDoS example implementation shall include the capability for the MUD URL <b>to be provided to a MUD manager.</b>			IoT-1-v4, IoT-1-v6
CR-2.a		The DHCP server shall <b>assign an IP address lease</b> to the MUD-enabled IoT device.		IoT-1-v4, IoT-1-v6

Capability Requirement (CR-ID)	Parent Requirement	Subrequirement 1	Subrequirement 2	Test Case
CR-2.a.1			The MUD-enabled IoT device shall <b>re-ceive the IP ad-dress</b> .	IoT-1-v4, IoT-1-v6
CR-2.b		<b>The DHCP server shall</b> receive the DHCP message and <b>extract the MUD URL, which is then passed to the MUD manager.</b>		IoT-1-v4, IoT-1-v6
CR-2.b.1			<b>The MUD manager shall receive the MUD URL.</b>	IoT-1-v4, IoT-1-v6
CR-3	The IoT DDoS example implementation shall include a <b>MUD manager that can re-quest a MUD file and signa-ture from a MUD file server.</b>			IoT-1-v4, IoT-1-v6
CR-3.a		The MUD manager shall use the GET method (RFC 7231) to <b>request MUD and signature files</b> (per RFC 7230) from the MUD file server and can <b>validate the MUD file server's TLS certificate</b> by using the rules in RFC 2818.		IoT-1-v4, IoT-1-v6

Capability Requirement (CR-ID)	Parent Requirement	Subrequirement 1	Subrequirement 2	Test Case
CR-3.a.1			<b>The MUD file server shall receive the https request from the MUD manager.</b>	IoT-1-v4, IoT-1-v6
CR-3.b		<b>The MUD manager</b> shall use the GET method (RFC 7231) to request MUD and signature files (per RFC 7230) from the MUD file server, but it <b>cannot validate the MUD file server's TLS certificate</b> by using the rules in RFC 2818.		IoT-2-v4, IoT-2-v6
CR-3.b.1			<b>The MUD manager shall drop the connection</b> to the MUD file server.	IoT-2-v4, IoT-2-v6
CR-3.b.2			<b>The MUD manager shall send locally defined policy to the router or switch</b> that handles whether to allow or block traffic to and from the MUD-enabled IoT device.	IoT-2-v4, IoT-2-v6
CR-4	The IoT DDoS example implementation shall include a <b>MUD file server that can</b>			IoT-1-v4, IoT-1-v6

Capability Requirement (CR-ID)	Parent Requirement	Subrequirement 1	Subrequirement 2	Test Case
	serve a MUD file and signature to the MUD manager.			
CR-4.a		The MUD file server shall serve the file and signature to the MUD manager, and the MUD manager shall check to determine whether the certificate used to sign the MUD file (signed using DER-encoded CMS [RFC 5652]) was valid at the time of signing, i.e., the <b>certificate had not expired</b> .		IoT-1-v4, IoT-1-v6
CR-4.b		The MUD file server shall serve the file and signature to the MUD manager, and the MUD manager shall check to determine whether the certificate used to sign the MUD file was valid at the time of signing, i.e., the <b>certificate had already expired when it was used to sign the MUD file</b> .		IoT-3-v4, IoT-3-v6

Capability Requirement (CR-ID)	Parent Requirement	Subrequirement 1	Subrequirement 2	Test Case
CR-4.b.1			The MUD manager shall cease to process the MUD file.	IoT-3-v4, IoT-3-v6
CR-4.b.2			The MUD manager shall send locally defined policy to the router or switch that handles whether to allow or block traffic to and from the MUD-enabled IoT device.	IoT-3-v4, IoT-3-v6
CR-5	The IoT DDoS example implementation shall include a <b>MUD manager that can translate local network configurations based on the MUD file.</b>			IoT-1-v4, IoT-1-v6
CR-5.a		<b>The MUD manager shall successfully validate the signature of the MUD file.</b>		IoT-1-v4, IoT-1-v6
CR-5.a.1			The MUD manager, after validation of the MUD file signature, shall <b>check for an existing MUD file and translate abstractions in the MUD file to router</b>	IoT-1-v4, IoT-1-v6

Capability Requirement (CR-ID)	Parent Requirement	Subrequirement 1	Subrequirement 2	Test Case
			<b>or switch configurations.</b>	
CR-5.a.2			The MUD manager shall <b>cache</b> this newly received MUD file.	IoT-10-v4, IoT-10-v6
CR-5.b		The MUD manager shall attempt to validate the signature of the <b>MUD file</b> , but the <b>signature validation fails</b> (even though the certificate that had been used to create the signature had not been expired at the time of signing, i.e., the signature is invalid for a different reason).		IoT-4-v4, IoT-4-v6
CR-5.b.1			<b>The MUD manager shall cease processing the MUD file.</b>	IoT-4-v4, IoT-4-v6
CR-5.b.2			<b>The MUD manager shall send locally defined policy to the router or switch</b> that handles whether to allow or block traffic to and	IoT-4-v4, IoT-4-v6

Capability Requirement (CR-ID)	Parent Requirement	Subrequirement 1	Subrequirement 2	Test Case
			from the MUD-enabled IoT device.	
CR-6	The IoT DDoS example implementation shall include a <b>MUD manager that can configure the MUD PEP</b> , i.e., the router or switch nearest the MUD-enabled IoT device that emitted the URL.			IoT-1-v4, IoT-1-v6
CR-6.a		<b>The MUD manager shall install a router configuration</b> on the router or switch nearest the MUD-enabled IoT device that emitted the URL.		IoT-1-v4, IoT-1-v6
CR-6.a.1			<b>The router or switch shall have been configured to enforce the route filter sent by the MUD manager.</b>	IoT-1-v4, IoT-1-v6
CR-7	The IoT DDoS example implementation shall <b>allow the MUD-enabled IoT device to communicate with approved internet services in the MUD file.</b>			IoT-5-v4, IoT-5-v6

Capability Requirement (CR-ID)	Parent Requirement	Subrequirement 1	Subrequirement 2	Test Case
CR-7.a		The MUD-enabled IoT device shall attempt to <b>initiate outbound traffic to approved internet services</b> .		IoT-5-v4, IoT-5-v6
CR-7.a.1			The router or switch shall receive the attempt and shall <b>allow it to pass</b> based on the filters from the MUD file.	IoT-5-v4, IoT-5-v6
CR-7.b		An approved <b>internet service shall attempt to initiate a connection to the MUD-enabled IoT device</b> .		IoT-5-v4, IoT-5-v6
CR-7.b.1			The router or switch shall receive the attempt and shall <b>allow it to pass</b> based on the filters from the MUD file.	IoT-5-v4, IoT-5-v6
CR-8	The IoT DDoS example implementation shall <b>deny communications from a MUD-enabled IoT device to unapproved internet services</b> (i.e., services that are denied by virtue of not being explicitly approved).			IoT-5-v4, IoT-5-v6

Capability Requirement (CR-ID)	Parent Requirement	Subrequirement 1	Subrequirement 2	Test Case
CR-8.a		The MUD-enabled IoT device shall <b>attempt to initiate outbound traffic to unapproved</b> (implicitly denied) <b>internet services</b> .		IoT-5-v4, IoT-5-v6
CR-8.a.1			<b>The router or switch shall receive the attempt and shall deny it</b> based on the filters from the MUD file.	IoT-5-v4, IoT-5-v6
CR-8.b		<b>An unapproved</b> (implicitly denied) <b>internet service shall attempt to initiate a connection to the MUD-enabled IoT device</b> .		IoT-5-v4, IoT-5-v6
CR-8.b.1			<b>The router or switch shall receive the attempt and shall deny it</b> based on the filters from the MUD file.	IoT-5-v4, IoT-5-v6
CR-8.c		The MUD-enabled IoT device shall initiate communications to an internet service that is <b>approved to</b>		IoT-5-v4, IoT-5-v6

Capability Requirement (CR-ID)	Parent Requirement	Subrequirement 1	Subrequirement 2	Test Case
		initiate communications with the MUD-enabled device but not approved to receive communications initiated by the MUD-enabled device.		
CR-8.c.1			The router or switch shall receive the attempt and shall deny it based on the filters from the MUD file.	IoT-5-v4, IoT-5-v6
CR-8.d		An internet service shall initiate communications to a MUD-enabled device that is <b>approved to initiate communications with the internet service</b> but that is not approved to receive communications initiated by the internet service.		IoT-5-v4, IoT-5-v6
CR-8.d.1			The router or switch shall receive the attempt and shall deny it based on the filters from the MUD file.	IoT-5-v4, IoT-5-v6

Capability Requirement (CR-ID)	Parent Requirement	Subrequirement 1	Subrequirement 2	Test Case
CR-9	The IoT DDoS example implementation shall <b>allow the MUD-enabled IoT device to communicate laterally with devices that are approved</b> in the MUD file.			IoT-6-v4, IoT-6-v6
CR-9.a		The MUD-enabled IoT device shall <b>attempt to initiate lateral traffic to approved devices.</b>		IoT-6-v4, IoT-6-v6
CR-9.a.1			<b>The router or switch shall receive the attempt and shall allow it to pass</b> based on the filters from the MUD file.	IoT-6-v4, IoT-6-v6
CR-9.b		An approved device <b>shall attempt to initiate a lateral connection to the MUD-enabled IoT device.</b>		IoT-6-v4, IoT-6-v6
CR-9.b.1			<b>The router or switch shall receive the attempt and shall allow it to pass</b> based on the filters from the MUD file.	IoT-6-v4, IoT-6-v6

Capability Requirement (CR-ID)	Parent Requirement	Subrequirement 1	Subrequirement 2	Test Case
CR-10	The IoT DDoS example implementation shall <b>deny lateral communications from a MUD-enabled IoT device to devices that are not approved</b> in the MUD file (i.e., devices that are implicitly denied by virtue of not being explicitly approved).			IoT-6-v4, IoT-6-v6
CR-10.a		The MUD-enabled IoT device shall <b>attempt to initiate lateral traffic to unapproved</b> (implicitly denied) <b>devices</b> .		IoT-6-v4, IoT-6-v6
CR-10.a.1			<b>The router or switch shall receive the attempt and shall deny it</b> based on the filters from the MUD file.	IoT-6-v4, IoT-6-v6
CR-10.b		<b>An unapproved</b> (implicitly denied) <b>device shall attempt to initiate a lateral connection</b> to the MUD-enabled IoT device.		IoT-6-v4, IoT-6-v6
CR-10.b.1			<b>The router or switch shall receive the attempt and shall deny it</b> based on the	IoT-6-v4, IoT-6-v6

Capability Requirement (CR-ID)	Parent Requirement	Subrequirement 1	Subrequirement 2	Test Case
			filters from the MUD file.	
CR-11	If the IoT DDoS example implementation is such that its DHCP server does not act as a MUD manager and it forwards a MUD URL to a MUD manager, <b>the DHCP server must notify the MUD manager of any corresponding change to the DHCP state</b> of the MUD-enabled IoT device, and the MUD manager should <b>remove the implemented policy configuration in the router/switch pertaining to that MUD-enabled IoT device</b> .			IoT-7-v4, IoT-7-v6
CR-11.a		The MUD-enabled IoT <b>device shall explicitly release the IP address lease</b> (i.e., it sends a DHCP release message to the DHCP server).		IoT-7-v4, IoT-7-v6
CR-11.a.1			<b>The DHCP server shall notify the MUD manager that the device's IP address lease has been released.</b>	IoT-7-v4, IoT-7-v6

Capability Requirement (CR-ID)	Parent Requirement	Subrequirement 1	Subrequirement 2	Test Case
CR-11.a.2			<b>The MUD manager should remove all policies</b> associated with the disconnected IoT device that had been configured on the MUD PEP router/switch.	IoT-7-v4, IoT-7-v6
CR-11.b		The MUD-enabled IoT <b>device's IP address lease shall expire.</b>		IoT-8-v4, IoT-8-v6
CR-11.b.1			<b>The DHCP server shall notify the MUD manager that the device's IP address lease has expired.</b>	IoT-8-v4, IoT-8-v6
CR-11.b.2			<b>The MUD manager should remove all policies</b> associated with the affected IoT device that had been configured on the MUD PEP router/switch.	IoT-8-v4, IoT-8-v6
CR-12	The IoT DDoS example implementation shall include a <b>MUD manager that uses a cached MUD file rather than retrieve a new one if</b>			IoT-10-v4, IoT-10-v6

Capability Requirement (CR-ID)	Parent Requirement	Subrequirement 1	Subrequirement 2	Test Case
	<b>the cache-validity time period has not yet elapsed</b> for the MUD file indicated by the MUD URL. <b>The MUD manager should fetch a new MUD file if the cache-validity time period has already elapsed.</b>			
CR-12.a		The MUD manager shall check if the file associated with the <b>MUD URL is present in its cache</b> and shall determine that it is.		IoT-10-v4, IoT-10-v6
CR-12.a.1			The MUD manager shall <b>check whether the amount of time that has elapsed since the cached file was retrieved is less than or equal to the number of hours in the cache-validity value for this MUD file.</b> If so, the MUD manager shall apply the contents of the cached MUD file.	IoT-10-v4, IoT-10-v6
CR-12.a.2			The MUD manager <b>shall check whether the amount of time that has elapsed since the cached file</b>	IoT-10-v4, IoT-10-v6

Capability Requirement (CR-ID)	Parent Requirement	Subrequirement 1	Subrequirement 2	Test Case
			was retrieved is greater than the number of hours in the cache-validity value for this MUD file. If so, the MUD manager may (but does not have to) fetch a new file by using the MUD URL received.	
CR-13	The IoT DDoS example implementation shall ensure that for each rule in a MUD file that pertains to an external domain, the MUD PEP router/switch will get configured with <b>all possible instantiations of that rule</b> , insofar as <b>each instantiation contains one of the IP addresses to which the domain in that MUD file rule may be resolved when queried by the MUD PEP router/switch</b> .			IoT-9-v4, IoT-9-v6
CR-13.a		The MUD file for a device shall contain a rule involving a <b>domain that can resolve to multiple IP addresses</b> when queried by the MUD PEP router/switch. <b>An</b>		IoT-9-v4, IoT-9-v6

Capability Requirement (CR-ID)	Parent Requirement	Subrequirement 1	Subrequirement 2	Test Case
		<b>ACL for permitting access to each of those IP addresses will be inserted into the MUD PEP router/switch</b> for the device in question, and the device will be permitted to communicate with all of those IP addresses.		
CR-13.a.1			IPv4 addressing is used on the network.	IoT-9-v4
CR-13.a.2			IPv6 addressing is used on the network.	IoT-9-v6

### 3.1.2 Test Cases

#### 3.1.2.1 Test Case IoT-1-v4

This section contains the test cases that were used to verify that Build 2 met the requirements listed in Table 3-1.

**Table 3-2: Test Case IoT-1-v4**

Test Case Field	Description
Parent Requirements	(CR-1) The IoT DDoS example implementation shall include a mechanism for associating a device with a MUD file URL (e.g., by having the MUD-enabled IoT device emit a MUD file URL via DHCP, LLDP, or X.509 or by using some other mechanism to enable the network to associate a device with a MUD file URL).

Test Case Field	Description
	<p>(CR-2) The IoT DDoS example implementation shall include the capability for the MUD URL to be provided to a MUD manager.</p> <p>(CR-3) The IoT DDoS example implementation shall include a MUD manager that can request a MUD file and signature from a MUD file server.</p> <p>(CR-4) The IoT DDoS example implementation shall include a MUD file server that can serve a MUD file and signature to the MUD manager.</p> <p>(CR-5) The IoT DDoS example implementation shall include a MUD manager that can translate local network configurations based on the MUD file.</p> <p>(CR-6) The IoT DDoS example implementation shall include a MUD manager that can configure the router or switch nearest the MUD-enabled IoT device that emitted the URL.</p>
Testable Requirements	<p>(CR-1.a) Upon initialization, the MUD-enabled IoT device shall broadcast a DHCP message on the network, including at most one MUD URL, in https scheme, within the DHCP transaction.</p> <p>(CR-1.a.1) The DHCP server shall be able to receive DHCPv4 DISCOVER and/or REQUEST with IANA code 161 (OPTION_MUD_URL_V4) from the MUD-enabled IoT device. (Note: Test IoT-1-v6 does not test this requirement; instead, it tests CR-1.a.2, which pertains to DHCPv6 rather than DHCPv4.)</p> <p>(CR-2.a) The DHCP server shall assign an IP address lease to the MUD-enabled IoT device.</p> <p>(CR-2.a.1) The MUD-enabled IoT device shall receive the IP address.</p> <p>(CR-2.b) The DHCP server shall receive the DHCP message and extract the MUD URL, which is then passed to the MUD manager.</p> <p>(CR-2.b.1) The MUD manager shall receive the MUD URL.</p> <p>(CR-3.a) The MUD manager shall use the GET method (RFC 7231) to request MUD and signature files (per RFC 7230) from the MUD file server and can validate the MUD file server's TLS certificate by using the rules in RFC 2818.</p> <p>(CR-3.a.1) The MUD file server shall receive the https request from the MUD manager.</p> <p>(CR-4.a) The MUD file server shall serve the file and signature to the MUD manager, and the MUD manager shall check to determine whether the certificate used to sign the MUD file (signed using DER-encoded CMS</p>

Test Case Field	Description
	<p>[RFC 5652]) was valid at the time of signing, i.e., the certificate had not expired.</p> <p>(CR-5.a) The MUD manager shall successfully validate the signature of the MUD file.</p> <p>(CR-5.a.1) The MUD manager, after validation of the MUD file signature, shall check for an existing MUD file and translate abstractions in the MUD file to router or switch configurations.</p> <p>(CR-6.a) The MUD manager shall install a router configuration on the router or switch nearest the MUD-enabled IoT device that emitted the URL.</p> <p>(CR-6.a.1) The router or switch shall have been configured to enforce the route filter sent by the MUD manager.</p>
Description	Shows that, upon connection to the network, a MUD-enabled IoT device used in the IoT DDoS example implementation has its MUD PEP router/switch automatically configured to enforce the route filtering that is described in the device's MUD file, assuming the MUD file has a valid signature and is served from a MUD file server that has a valid TLS certificate
Associated Test Case(s)	N/A
Associated Cybersecurity Framework Subcategory(ies)	ID.AM-1, ID.AM-2, ID.AM-3, PR.DS-5, DE.AE-1, PR.AC-4, PR.AC-5, PR.IP-1, PR.IP-3, PR.PT-3, PR.DS-2
IoT Device(s) Under Test	Raspberry Pi (1)
MUD File(s) Used	<i>Yikesmain.json</i>
Preconditions	<ol style="list-style-type: none"> <li>1. This MUD file is not currently cached at the MUD manager.</li> <li>2. The device's MUD file has a valid signature that was signed by a certificate that had not yet expired, and it is being hosted on a MUD file server that has a valid TLS certificate.</li> <li>3. The MUD PEP router/switch does not yet have any configuration settings pertaining to the IoT device being used in the test.</li> </ol>

Test Case Field	Description
	<p>4. The MUD file for the IoT device being used in the test is identical to the MUD file provided in Section 3.1.3.</p>
Procedure	<p>Verify that the MUD PEP router/switch for the IoT device to be used in the test does not yet have any configuration settings installed with respect to the IoT device being used in the test. Also verify that the MUD file of the IoT device to be used is not currently cached at the MUD manager.</p> <p>Power on the IoT device and connect it to the test network. This should set in motion the following series of steps, which should occur automatically:</p> <ol style="list-style-type: none"> <li>1. The IoT device automatically emits a MUD URL in a DHCPv4 message containing the device's MUD URL (IANA code 161). (Note that in the v6 version of this test, IPv6, DHCPv6, and IANA code 112 will be used.)</li> <li>2. The DHCP server offers an IP address lease to the newly connected IoT device.</li> <li>3. The IoT device requests this IP address lease, which the DHCP server acknowledges.</li> <li>4. The DHCP server receives the DHCP message containing the IoT device's MUD URL.</li> <li>5. The DHCP service extracts the MUD URL.</li> <li>6. The MUD URL is then provided to the MUD manager.</li> <li>7. The MUD manager automatically contacts the MUD file server that is located by using the MUD URL, verifies that it has a valid TLS certificate, requests and receives the MUD file and signature from the MUD file server, validates the MUD file's signature, and translates the MUD file's contents into appropriate route filtering rules. The MUD manager installs these rules onto the MUD PEP for the IoT device in question so that this router/switch is now configured to enforce the policies specified in the MUD file.</li> </ol>
Expected Results	<p>The MUD PEP router/switch for the IoT device has had its configuration changed, i.e., it has been configured to enforce the policies specified in</p>

Test Case Field	Description
	<p>the IoT device's MUD file. The expected configuration should resemble the following:</p> <pre> config rule     option enabled      '1'     option name         'mud_192.168.20.222_main-pi- Build2_cl0-frdev'     option target       ACCEPT     option src          lan     option dest         wan     option proto        tcp     option family       ipv4     option src_ip       192.168.20.222     option dest_ip      198.71.233.87     option dest_port    443:443  config rule     option enabled      '1'     option name         'mud_192.168.20.222_main-pi- Build2_cl0-todev'     option target       ACCEPT     option src          wan     option dest         lan     option proto        tcp     option family       ipv4     option src_ip       198.71.233.87     option dest_ip      192.168.20.222     option dest_port    443:443  config rule     option enabled      '1'     option name         'mud_192.168.20.222_main-pi- Build2_cl1-frdev'     option target       ACCEPT     option src          lan     option dest         wan     option proto        tcp     option family       ipv4     option src_ip       192.168.20.222     option dest_ip      192.168.4.7     option dest_port    80:80  config rule     option enabled      '1'     option name         'mud_192.168.20.222_main-pi- Build2_cl1-todev'     option target       ACCEPT </pre>

Overall Results	Pass

Test case IoT-1-v6 is identical to test case IoT-1-v4 except that IoT-1-v6 tests requirement CR-1.a.2, whereas IoT-1-v4 tests requirement CR-1.a.1. Hence, as explained above, test IoT-1-v6 uses IPv6, DHCPv6, and IANA code 112 instead of using IPv4, DHCPv4, and IANA code 161.

### 3.1.2.2 Test Case IoT-2-v4

**Table 3-3: Test Case IoT-2-v4**

Test Case Field	Description
Parent Requirement	(CR-3) The IoT DDoS example implementation shall include a MUD manager that can request a MUD file and signature from a MUD file server.
Testable Requirement	<p>(CR-3.b) The MUD manager shall use the GET method (RFC 7231) to request MUD and signature files (per RFC 7230) from the MUD file server, but it cannot validate the MUD file server's TLS certificate by using the rules in RFC 2818.</p> <p>(CR-3.b.1) The MUD manager shall drop the connection to the MUD file server.</p>

Test Case Field	Description
	(CR-3.b.2) The MUD manager shall send locally defined policy to the router or switch that handles whether to allow or block traffic to and from the MUD-enabled IoT device.
Description	Shows that if a MUD manager cannot validate the TLS certificate of a MUD file server when trying to retrieve the MUD file for a specific IoT device, the MUD manager will drop the connection to the MUD file server and configure the router/switch according to locally defined policy regarding whether to allow or block traffic to the IoT device in question
Associated Test Case(s)	IoT-11-v4 (for the v6 version of this test, IoT-11-v6)
Associated Cybersecurity Framework Subcategory(ies)	PR.AC-7
IoT Device(s) Under Test	Raspberry Pi
MUD File(s) Used	<i>Yikesmain.json, yikesmantest.json</i>
Preconditions	<ol style="list-style-type: none"> <li>1. All devices have been configured to use IPv4.</li> <li>2. This MUD file is not currently cached at the MUD manager.</li> <li>3. The MUD file server that is hosting the MUD file of the device under test does not have a valid TLS certificate.</li> <li>4. Local policy has been defined to ensure that if the MUD file for a device is located on a server with an invalid certificate, the router/switch will be configured to deny all communication to and from the device.</li> <li>5. The MUD PEP router/switch for the IoT device to be used in the test does not yet have any configuration settings with respect to the IoT device being used in the test.</li> </ol>

Test Case Field	Description
Procedure	<p>Verify that the MUD PEP router/switch for the IoT device to be used in the test does not yet have any configuration settings installed with respect to the IoT device being used in the test.</p> <p>Power on the IoT device and connect it to the test network. This should set in motion the following series of steps, which should occur automatically:</p> <ol style="list-style-type: none"> <li>1. The IoT device automatically emits a DHCPv4 message containing the device's MUD URL (IANA code 161). (Note that in the v6 version of this test, IPv6, DHCPv6, and IANA code 112 will be used.)</li> <li>2. The DHCP server receives the DHCP message containing the IoT device's MUD URL.</li> <li>3. The DHCP server offers an IP address lease to the newly connected IoT device.</li> <li>4. The IoT device requests this IP address lease, which the DHCP server acknowledges.</li> <li>5. The DHCP server sends the MUD URL to the MUD manager.</li> <li>6. The MUD manager automatically contacts the MUD file server that is located by using the MUD URL, determines that it does not have a valid TLS certificate, and drops the connection to the MUD file server.</li> <li>7. The MUD manager configures the router/switch that is closest to the IoT device according to locally defined policy, which in this case allows traffic to the IoT device in question.</li> </ol>
Expected Results	The MUD PEP router/switch for the IoT device has had its configuration changed, i.e., it has been configured to local policy for communication to/from the IoT device.
Actual Results	<p><b>Procedures 1–4:</b></p> <pre>pi@main-pi-Build2:~\$ sudo dhclient -v -i eth0 sudo: unable to resolve host main-pi-Build2: Connection refused Internet Systems Consortium DHCP Client 4.3.5 Copyright 2004-2016 Internet Systems Consortium.</pre>

As explained above, test IoT-2-v6 is identical to test IoT-2-v4 except that it uses IPv6, DHCPv6, and IANA code 112 instead of using IPv4, DHCPv4, and IANA code 161.

### 3.1.2.3 Test Case IoT-3-v4

**Table 3-4: Test Case IoT-3-v4**

Test Case Field	Description
Parent Requirement	(CR-4) The IoT DDoS example implementation shall include a MUD file server that can serve a MUD file and signature to the MUD manager.
Testable Requirement	<p>(CR-4.b) The MUD file server shall serve the file and signature to the MUD manager, and the MUD manager shall check to determine whether the certificate used to sign the MUD file was valid at the time of signing, i.e., the certificate had already expired when it was used to sign the MUD file.</p> <p>(CR-4.b.1) The MUD manager shall cease to process the MUD file.</p> <p>(CR-4.b.2) The MUD manager shall send locally defined policy to the router or switch that handles whether to allow or block traffic to and from the MUD-enabled IoT device.</p>
Description	Shows that if a MUD file server serves a MUD file with a signature that was created with an expired certificate, the MUD manager will cease processing the MUD file
Associated Test Case(s)	IoT-11-v4 (for the v6 version of this test, IoT-11-v6)
Associated Cybersecurity Framework Subcategory(ies)	PR.DS-6
IoT Device(s) Under Test	Raspberry Pi
MUD File(s) Used	<i>ExpiredCertTest.json</i>
Preconditions	<ol style="list-style-type: none"> <li>1. This MUD file is not currently cached at the MUD manager.</li> <li>2. The IoT device's MUD file is being hosted on a MUD file server that has a valid TLS certificate, but the MUD file signature was signed by a certificate that had already expired at the time of signature.</li> <li>3. Local policy has been defined to ensure that if the MUD file for a device has a signature that was signed by a certificate that had already expired at the time of signature, the device's MUD PEP</li> </ol>

Test Case Field	Description
	<p>router/switch will be configured to deny all communication to/from the device.</p> <p>4. The MUD PEP router/switch for the IoT device to be used in the test does not yet have any configuration settings with respect to the IoT device being used in the test.</p>
Procedure	<p>Verify that the MUD PEP router/switch for the IoT device to be used in the test does not yet have any configuration settings installed with respect to the IoT device being used in the test.</p> <p>Power on the IoT device and connect it to the test network. This should set in motion the following series of steps, which should occur automatically:</p> <ol style="list-style-type: none"> <li>1. The IoT device automatically emits a DHCPv4 message containing the device's MUD URL (IANA code 161). (Note that in the v6 version of this test, IPv6, DHCPv6, and IANA code 112 will be used.)</li> <li>2. The DHCP server receives the DHCP message containing the IoT device's MUD URL.</li> <li>3. The DHCP server offers an IP address lease to the newly connected IoT device.</li> <li>4. The IoT device requests this IP address lease, which the DHCP server acknowledges.</li> <li>5. The DHCP server sends the MUD URL to the MUD manager.</li> <li>6. The MUD manager automatically contacts the MUD file server that is located by using the MUD URL, verifies that it has a valid TLS certificate, and requests the MUD file and signature from the MUD file server.</li> <li>7. The MUD file server serves the MUD file and signature to the MUD manager, and the MUD manager detects that the MUD file's signature was created by using a certificate that had already expired at the time of signing.</li> <li>8. The MUD manager configures the router/switch that is closest to the IoT device so that it allows all communications to and from the IoT device.</li> </ol>

Test Case Field	Description
Expected Results	<p>The MUD PEP router/switch for the IoT device has had its configuration changed, i.e., it has been configured to deny all communication to and from the IoT device. The expected configuration should resemble the following.</p> <p>Expecting a show access session without a MUD file as seen below:</p> <pre># OSMUD start # # DO NOT EDIT THESE LINES. Test Case Field	Description
	<pre> option src_ip      192.168.20.197 # OSMUD end </pre>
Overall Results	Pass

As explained above, test IoT-3-v6 is identical to test IoT-3-v4 except that it uses IPv6, DHCPv6, and IANA code 112 instead of using IPv4, DHCPv4, and IANA code 161.

### 3.1.2.4 Test Case IoT-4-v4

**Table 3-5: Test Case IoT-4-v4**

Test Case Field	Description
Parent Requirement	(CR-5) The IoT DDoS example implementation shall include a MUD manager that can translate local network configurations based on the MUD file.
Testable Requirement	<p>(CR-5.b) The MUD manager shall attempt to validate the signature of the MUD file, but the signature validation fails (even though the certificate that had been used to create the signature had not been expired at the time of signing, i.e., the signature is invalid for a different reason).</p> <p>(CR-5.b.1) The MUD manager shall cease processing the MUD file.</p> <p>(CR-5.b.2) The MUD manager shall send locally defined policy to the router or switch that handles whether to allow or block traffic to and from the MUD-enabled IoT device.</p>
Description	Shows that if the MUD manager determines that the signature on the MUD file it receives from the MUD file server is invalid, it will cease processing the MUD file and configure the router/switch according to locally defined policy regarding whether to allow or block traffic to the IoT device in question
Associated Test Case(s)	IoT-11-v4 (for the v6 version of this test, IoT-11-v6)

Test Case Field	Description
Associated Cybersecurity Framework Subcategory(ies)	PR.DS-6
IoT Device(s) Under Test	Raspberry Pi
MUD File(s) Used	<i>cr-5b.json</i>
Preconditions	<ol style="list-style-type: none"> <li>1. This MUD file is not currently cached at the MUD manager.</li> <li>2. The MUD file that is served from the MUD file server to the MUD manager has a signature that is invalid, even though it was signed by a certificate that had not expired at the time of signing.</li> <li>3. Local policy has been defined to ensure that if the MUD file for a device has an invalid signature, the device's MUD PEP router/switch will be configured to deny all communication to/from the device.</li> <li>4. The MUD PEP router/switch does not yet have any configuration settings with respect to the IoT device being used in the test.</li> </ol>
Procedure	<p>Verify that the MUD PEP router/switch for the IoT device to be used in the test does not yet have any configuration settings installed with respect to the IoT device being used in the test.</p> <p>Power on the IoT device and connect it to the test network. This should set in motion the following series of steps, which should occur automatically:</p> <ol style="list-style-type: none"> <li>1. The IoT device automatically emits a DHCPv4 message containing the device's MUD URL (IANA code 161). (Note that in the v6 version of this test, IPv6, DHCPv6, and IANA code 112 will be used.)</li> <li>2. The DHCP server receives the DHCP message containing the IoT device's MUD URL.</li> <li>3. The DHCP server offers an IP address lease to the newly connected IoT device.</li> <li>4. The IoT device requests this IP address lease, which the DHCP server acknowledges.</li> <li>5. The DHCP server sends the MUD URL to the MUD manager.</li> </ol>

Test Case Field	Description
	<ol style="list-style-type: none"> <li>6. The MUD manager automatically contacts the MUD file server that is located by using the MUD URL, verifies that it has a valid TLS certificate, and requests the MUD file and signature from the MUD file server.</li> <li>7. The MUD file server sends the MUD file, and the MUD manager detects that the MUD file's signature is invalid.</li> <li>8. The MUD manager configures the router/switch that is closest to the IoT device so that it allows all communications to and from the IoT device.</li> </ol>
Expected Results	<p>The MUD PEP router/switch for the IoT device has had its configuration changed, i.e., it has been configured to deny all communication to/from the IoT device. Test Case Field	Description
	<pre> config rule     option enabled    '1'     option name       'mud_192.168.20.197_same-manufac- ture-pi_REJECT-ALL-LOCAL-FROM'     option target     REJECT     option src        lan     option dest       lan     option proto      all     option family     ipv4     option src_ip     192.168.20.197  config rule     option enabled    '1'     option name       'mud_192.168.20.197_same-manufac- ture-pi_REJECT-ALL-LOCAL-TO'     option target     REJECT     option src        lan     option dest       lan     option proto      all     option family     ipv4     option src_ip     any     option dest_ip    192.168.20.197  config rule     option enabled    '1'     option name       'mud_192.168.20.197_same-manufac- ture-pi_REJECT-ALL'     option target     REJECT     option src        lan     option dest       wan     option proto      all     option family     ipv4     option src_ip     192.168.20.197 # OSMUD end </pre>
Overall Results	Pass

As explained above, test IoT-4-v6 is identical to test IoT-4-v4 except that it uses IPv6, DHCPv6, and IANA code 112 instead of using IPv4, DHCPv4, and IANA code 161.

### 3.1.2.5 Test Case IoT-5-v4

**Table 3-6: Test Case IoT-5-v4**

Test Case Field	Description
Parent Requirement	<p>(CR-7) The IoT DDoS example implementation shall allow the MUD-enabled IoT device to communicate with approved internet services in the MUD file.</p> <p>(CR-8) The IoT DDoS example implementation shall deny communications from a MUD-enabled IoT device to unapproved internet services (i.e., services that are implicitly denied by virtue of not being explicitly approved).</p>
Testable Requirement	<p>(CR-7.a) The MUD-enabled IoT device shall attempt to initiate outbound traffic to approved internet services.</p> <p>(CR-7.a.1) The router or switch shall receive the attempt and shall allow it to pass based on the filters from the MUD file.</p> <p>(CR-7.b) An approved internet service shall attempt to initiate connection to the MUD-enabled IoT device.</p> <p>(CR-7.b.1) The router or switch shall receive the attempt and shall allow it to pass based on the filters from the MUD file.</p> <p>(CR-8.a) The MUD-enabled IoT device shall attempt to initiate outbound traffic to unapproved (implicitly denied) internet services.</p> <p>(CR-8.a.1) The router or switch shall receive the attempt and shall deny it based on the filters from the MUD file.</p> <p>(CR-8.b) An unapproved (implicitly denied) internet service shall attempt to initiate a connection to the MUD-enabled IoT device.</p> <p>(CR-8.b.1) The router or switch shall receive the attempt and shall deny it based on the filters from the MUD file.</p> <p>(CR-8.c) The MUD-enabled IoT device shall initiate communications to an internet service that is approved to initiate communications with the MUD-enabled device but not approved to receive communications initiated by the MUD-enabled device.</p> <p>(CR-8.c.1) The router or switch shall receive the attempt and shall deny it based on the filters from the MUD file.</p> <p>(CR-8.d) An internet service shall initiate communications to a MUD-enabled device that is approved to initiate communications with the internet service but that is not approved to receive communications initiated by the internet service.</p> <p>(CR-8.d.1) The router or switch shall receive the attempt and shall deny it based on the filters from the MUD file.</p>

Test Case Field	Description
Description	Shows that, upon connection to the network, a MUD-enabled IoT device used in the IoT DDoS example implementation has its MUD PEP router/switch automatically configured to enforce the route filtering that is described in the device's MUD file with respect to communication with internet services. Further shows that the policies that are configured on the MUD PEP router/switch with respect to communication with internet services will be enforced as expected, with communications that are configured as denied being blocked and communications that are configured as permitted being allowed.
Associated Test Case(s)	IoT-1-v4 (for the v6 version of this test, IoT-1-v6)
Associated Cybersecurity Framework Subcategory(ies)	ID.AM-3, PR.DS-5, PR.IP-1, PR.PT-3
IoT Device(s) Under Test	Raspberry Pi
MUD File(s) Used	<i>Yikesmain.json</i>
Preconditions	<p>Test IoT-1-v4 (or IoT-1-v6) has run successfully, meaning that the MUD PEP router/switch has been configured to enforce the following policies for the IoT device in question (as defined in the MUD file in Section 3.1.3):</p> <p>Note: Procedure steps with strike-through were not tested due to network address translation (NAT).</p> <ul style="list-style-type: none"> <li>a) <del>Explicitly permit <i>https://yes-permit-from.com</i> to initiate communications with the IoT device.</del></li> <li>b) Explicitly permit the IoT device to initiate communications with <i>https://yes-permit-to.com</i>.</li> <li>c) Implicitly deny all other communications with the internet, including denying <ul style="list-style-type: none"> <li>i) the IoT device to initiate communications with <i>https://yes-permit-from.com</i></li> </ul> </li> </ul>

Test Case Field	Description
	<ul style="list-style-type: none"> <li>ii) <del>https://yes-permit-to.com</del> to initiate communications with the IoT device</li> <li>iii) communication between the IoT device and all other internet locations, such as <del>https://unnamed-to.com</del> (by not mentioning this or any other URLs in the MUD file)</li> </ul>
Procedure	<p>Note: Procedure steps with strike-through were not tested due to NAT.</p> <ol style="list-style-type: none"> <li>1. As stipulated in the preconditions, just before this test, test IoT-1-v4 (or IoT-1-v6) must have been run successfully.</li> <li>2. Initiate communications from the IoT device to <del>https://yes-permit-to.com</del> and verify that this traffic is received at <del>https://yes-permit-to.com</del>. (egress)</li> <li>3. <del>Initiate communications to the IoT device from https://yes-permit-to.com and verify that this traffic is received at the MUD PEP, but it is not forwarded by the MUD PEP, nor is it received at the IoT device. (ingress)</del></li> <li>4. <del>Initiate communications to the IoT device from https://yes-permit-from.com and verify that this traffic is received at the IoT device. (ingress)</del></li> <li>5. <del>Initiate communications from the IoT device to https://yes-permit-from.com and verify that this traffic is received at the MUD PEP, but it is not forwarded by the MUD PEP, nor is it received at https://yes-permit-from.com. (ingress)</del></li> <li>6. Initiate communications from the IoT device to <del>https://unnamed.com</del> and verify that this traffic is received at the MUD PEP, but it is not forwarded by the MUD PEP, nor is it received at <del>https://unnamed.com</del>. (egress)</li> <li>7. <del>Initiate communications to the IoT device from https://unnamed.com and verify that this traffic is received at the MUD PEP, but it is not forwarded by the MUD PEP, nor is it received at the IoT device. (ingress)</del></li> </ol>
Expected Results	Each of the results that is listed as needing to be verified in procedure steps above occurs as expected.

Connecting to www.twitter.com (www.twitter.com) 104.244.42.65 :443... failed: Connection refused.</pre>
Overall Results	Pass (for testable procedures, ingress cannot be tested due to NAT)

As explained above, test IoT-5-v6 is identical to test IoT-5-v4 except that it uses IPv6, DHCPv6, and IANA code 112 instead of using IPv4, DHCPv4, and IANA code 161.

### 3.1.2.6 Test Case IoT-6-v4

**Table 3-7: Test Case IoT-6-v4**

Test Case Field	Description
Parent Requirement	(CR-9) The IoT DDoS example implementation shall allow the MUD-enabled IoT device to communicate laterally with devices that are approved in the MUD file.

Test Case Field	Description
	(CR-10) The IoT DDoS example implementation shall deny lateral communications from a MUD-enabled IoT device to devices that are not approved in the MUD file (i.e., devices that are implicitly denied by virtue of not being explicitly approved).
Testable Requirement	<p>(CR-9.a) The MUD-enabled IoT device shall attempt to initiate lateral traffic to approved devices.</p> <p>(CR-9.a.1) The router or switch shall receive the attempt and shall allow it to pass based on the filters from the MUD file.</p> <p>(CR-9.b) An approved device shall attempt to initiate a lateral connection to the MUD-enabled IoT device.</p> <p>(CR-9.b.1) The router or switch shall receive the attempt and shall allow it to pass based on the filters from the MUD file.</p> <p>(CR-10.a) The MUD-enabled IoT device shall attempt to initiate lateral traffic to unapproved (implicitly denied) devices.</p> <p>(CR-10.a.1) The router or switch shall receive the attempt and shall deny it based on the filters from the MUD file.</p> <p>(CR-10.b) An unapproved (implicitly denied) device shall attempt to initiate a lateral connection to the MUD-enabled IoT device.</p> <p>(CR-10.b.1) The router or switch shall receive the attempt and shall deny it based on the filters from the MUD file.</p>
Description	Shows that, upon connection to the network, a MUD-enabled IoT device used in the IoT DDoS example implementation has its MUD PEP router/switch automatically configured to enforce the route filtering that is described in the device's MUD file with respect to communication with lateral devices. Further shows that the policies that are configured on the MUD PEP router/switch with respect to communication with lateral devices will be enforced as expected, with communications that are configured as denied being blocked and communications that are configured as permitted being allowed.
Associated Test Case(s)	IoT-1-v4 (for the v6 version of this test, IoT-1-v6)
Associated Cybersecurity Framework Subcategory(ies)	ID.AM-3, PR.DS-5, PR.AC-5, PR.IP-1, PR.PT-3, PR.IP-3, PR.DS-3

Test Case Field	Description
IoT Device(s) Under Test	Raspberry Pi (3)
MUD File(s) Used	<i>Fe-localnetwork.json, Fe-my-controller.json, Fe-controller.json, Fe-manufacturer1.json, Fe-manufacturer2.json, Fe-samemanufacturer.json, Fe-localnetwork-to2.json, Fe-localnetwork-from2.json, Fe-samemanufacturer-from2.json, Fe-samemanufacturer-to2.json</i>
Preconditions	<p>Test IoT-1-v4 (or IoT-1-v6) has run successfully, meaning that the MUD PEP router/switch has been configured to enforce the following policies for the IoT device in question with respect to local communications (as defined in the MUD files in Section 3.1.3):</p> <ul style="list-style-type: none"> <li>a) Local-network class—Explicitly permit <b>local communication to and from the IoT device and any local hosts</b> (including the specific local hosts <i>anyhost-to</i> and <i>anyhost-from</i>) <b>for specific services</b>, as specified in the MUD file by source port: any; destination port: 80; and protocol: TCP, and which party initiates the connection.</li> <li>b) Manufacturer class—Explicitly permit <b>local communication to and from the IoT device and other classes of IoT devices, as identified by their MUD URL (<i>www.devicetype.com</i>)</b>, and further constrained by source port: any; destination port: 80; and protocol: TCP.</li> <li>c) Same-manufacturer class—Explicitly permit <b>local communication to and from IoT devices of the same manufacturer as the IoT device in question (the domain in the MUD URLs (<i>mudfileservers</i>) of the other IoT devices is the same as the domain in the MUD URL (<i>mudfileservers</i>) of the IoT device in question)</b>, and further constrained by source port: any; destination port: 80; and protocol: TCP.</li> <li>d) Implicitly deny all other local communication that is not explicitly permitted in the MUD file, including denying <ul style="list-style-type: none"> <li>i) <b><i>anyhost-to</i> to initiate communications</b> with the IoT device</li> <li>ii) <b>the IoT device to initiate communications with <i>anyhost-to</i> by using a source port, destination port, or protocol (TCP or UDP) that is not explicitly permitted</b></li> </ul> </li> </ul>

Test Case Field	Description
	<ul style="list-style-type: none"> <li>iii) the IoT device to initiate communications with <i>anyhost-from</i></li> <li>iv) <i>anyhost-from</i> to initiate communications with the IoT device by using a source port, destination port, or protocol (TCP or UDP) that is not explicitly permitted</li> <li>v) communications between the IoT device and all lateral hosts (including <i>unnamed-host</i>) whose MUD URLs are not explicitly mentioned as being permissible in the MUD file</li> <li>vi) communications between the IoT device and all lateral hosts whose MUD URLs are explicitly mentioned as being permissible but using a source port, destination port, or protocol (TCP or UDP) that is not explicitly permitted</li> <li>vii) communications between the IoT device and all lateral hosts that are not from the same manufacturer as the IoT device in question</li> <li>viii) communications between the IoT device and a lateral host that is from the same manufacturer but using a source port, destination port, or protocol (TCP or UDP) that is not explicitly permitted</li> </ul>
Procedure	<ol style="list-style-type: none"> <li>1. As stipulated in the preconditions, just before this test, test IoT-1-v4 (or IoT-1-v6) must have been run successfully.</li> <li>2. Overall Results	Pass

As explained above, test IoT-6-v6 is identical to test IoT-6-v4 except that it uses IPv6, DHCPv6, and IANA code 112 instead of using IPv4, DHCPv4, and IANA code 161.

### 3.1.2.7 Test Case IoT-7-v4

**Table 3-8: Test Case IoT-7-v4**

Test Case Field	Description
Parent Requirement	(CR-11) If the IoT DDoS example implementation is such that its DHCP server does not act as a MUD manager and it forwards a MUD URL to a MUD manager, the DHCP server must notify the MUD manager of any corresponding change to the DHCP state of the MUD-enabled IoT device, and the MUD manager should remove the implemented policy configuration in the router/switch pertaining to that MUD-enabled IoT device.
Testable Requirement	(CR-11.a) The MUD-enabled IoT device shall explicitly release the IP address lease (i.e., it sends a DHCP release message to the DHCP server). (CR-11.a.1) The DHCP server shall notify the MUD manager that the device's IP address lease has been released.

Test Case Field	Description
	(CR-11.a.2) The MUD manager should remove all policies associated with the disconnected IoT device that had been configured on the MUD PEP router/switch.
Description	Shows that when a MUD-enabled IoT device explicitly releases its IP address lease, the MUD-related configuration for that IoT device will be removed from its MUD PEP router/switch
Associated Test Case(s)	IoT-1-v4 (or IoT-1-v6 when IPv6 addressing is used)
Associated Cybersecurity Framework Subcategory(ies)	PR.IP-3, PR.DS-3
IoT Device(s) Under Test	Raspberry Pi
MUD File(s) Used	<i>Fe-samemanufacturer.json</i>
Preconditions	Test IoT-1-v4 (or IoT-1-v6) has run successfully, meaning that the MUD PEP router/switch has been configured to enforce the policies defined in the MUD file in Section 3.1.3 for the IoT device in question.
Procedure	<ol style="list-style-type: none"> <li>1. As stipulated in the preconditions, just before this test, test IoT-1-v4 (or IoT-1-v6) must have been run successfully. Verify that the MUD PEP router/switch for the IoT device has been configured to enforce the policies listed in the preconditions section above for the IoT device in question.</li> <li>2. Cause a DHCP release of the IoT device in question.</li> <li>3. Check the log file for the MUD manager to verify that it was notified of the change of DHCP state.</li> <li>4. Verify that all the configuration rules listed above have been removed from the MUD PEP router/switch for the IoT device in question.</li> </ol>
Expected Results	All of the configuration rules listed above have been removed from the MUD PEP router/switch for the IoT device in question.

Test Case Field	Description

Overall Results	Pass

As explained above, test IoT-7-v6 is identical to test IoT-7-v4 except that it uses IPv6, DHCPv6, and IANA code 112 instead of using IPv4, DHCPv4, and IANA code 161.

#### 3.1.2.8 Test Case IoT-8-v4

**Table 3-9: Test Case IoT-8-v4**

Test Case Field	Description
Parent Requirement	(CR-11) If the IoT DDoS example implementation is such that its DHCP server does not act as a MUD manager and it forwards a MUD URL to a MUD manager, the DHCP server must notify the MUD manager of any corresponding change to the DHCP state of the MUD-enabled IoT device, and the MUD manager should remove the implemented policy configuration in the router/switch pertaining to that MUD-enabled IoT device.

Test Case Field	Description
Testable Requirement	(CR-11.b) The MUD-enabled IoT device's IP address lease shall expire. (CR-11.b.1) The DHCP server shall notify the MUD manager that the device's IP address lease has expired. (CR-11.b.2) The MUD manager should remove all policies associated with the affected IoT device that had been configured on the MUD PEP router/switch.
Description	Shows that when a MUD-enabled IoT device's IP address lease expires, the MUD-related configuration for that IoT device will be removed from its MUD PEP router/switch
Associated Test Case(s)	IoT-1-v4 (or IoT-1-v6 when IPv6 addressing is used)
Associated Cybersecurity Framework Subcategory(ies)	PR.IP-3, PR.DS-3
IoT Device(s) Under Test	Raspberry Pi
MUD File(s) Used	<i>Fe-manufacturer1.json</i>
Preconditions	Test IoT-1-v4 (or IoT-1-v6) has run successfully, meaning that the MUD PEP router/switch has been configured to enforce the policies defined in the MUD file in Section 3.1.3 for the IoT device in question.
Procedure	<ol style="list-style-type: none"> <li>1. Configure the DHCP server to have a DHCP lease time of 60 minutes.</li> <li>2. Run test IoT-1-v4 (or IoT-1-v6).</li> <li>3. Verify that the MUD PEP router/switch for the IoT device has been configured to enforce the policies listed above for the IoT device in question.</li> <li>4. Disconnect the IoT device in question from the network.</li> <li>5. After 60 minutes have elapsed, (1) look at the log file for the MUD manager to verify that it has received notice of the change of DHCP state, and (2) verify that all of the configuration rules listed above</li> </ol>

Test Case Field	Description
	have been removed from the MUD PEP router/switch for the IoT device in question.
Expected Results	Once 60 minutes have elapsed after disconnecting the IoT device from the network, all of the configuration rules listed above have been removed from the MUD PEP router/switch for the IoT device in question.
Actual Results	<p><b>Procedures 1–4:</b></p> <p><b>Completed; excluded for brevity</b></p> <p><b>Procedure 5:</b></p> <p><b>1. As explained above, test IoT-8-v6 is identical to test IoT-8-v4 except that it uses IPv6, DHCPv6, and IANA code 112 instead of using IPv4, DHCPv4, and IANA code 161.

### 3.1.2.9 Test Case IoT-9-v4

**Table 3-10: Test Case IoT-9-v4**

Test Case Field	Description
Parent Requirements	(CR-13) The IoT DDoS example implementation shall ensure that for each rule in a MUD file that pertains to an external domain, the MUD PEP router/switch will get configured with all possible instantiations of that rule, insofar as each instantiation contains one of the IP addresses

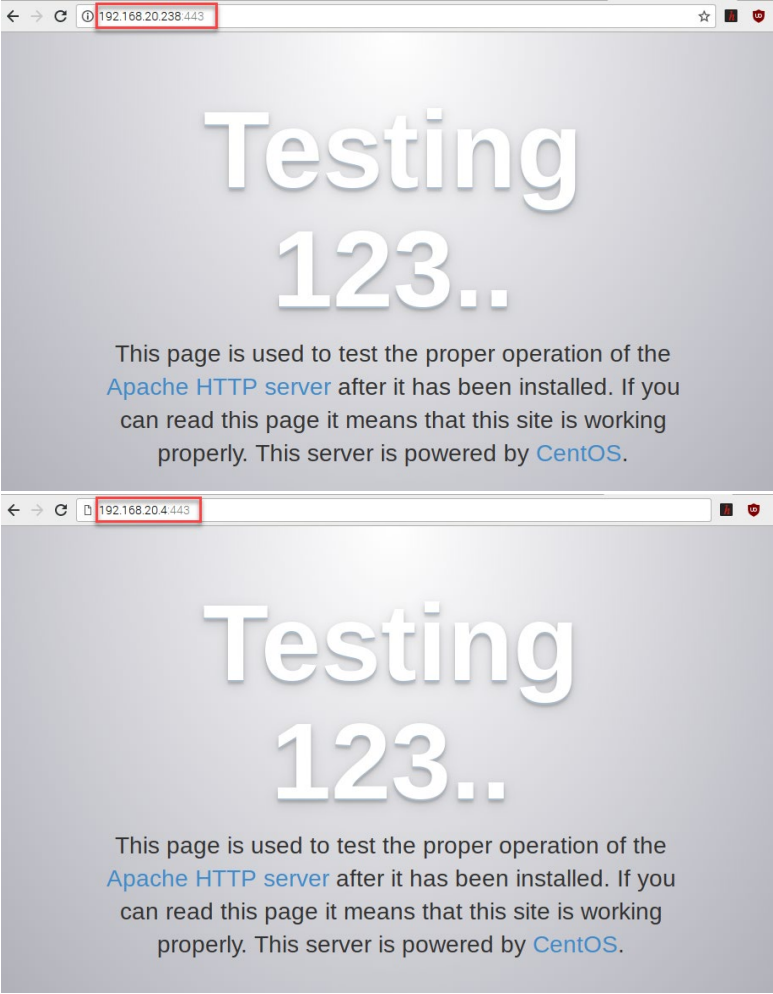

Test Case Field	Description
	to which the domain in that MUD file rule may be resolved when queried by the MUD PEP router/switch.
Testable Requirements	(CR-13.a) The MUD file for a device shall contain a rule involving an external <b>domain that can resolve</b> to multiple IP addresses when queried by the MUD PEP router/switch. An ACL for permitting access to each of those IP addresses will be inserted into the MUD PEP router/switch for the device in question, and the device will be permitted to communicate with all of those IP addresses.
Description	Shows that if a domain in a MUD file rule resolves to multiple IP addresses when the address resolution is queried by the network gateway, then <ol style="list-style-type: none"> <li>1. ACLs instantiating that MUD file rule corresponding to each of these IP addresses will be configured in the gateway for the IoT device associated with the MUD file, and</li> <li>2. the IoT device associated with the MUD file will be permitted to communicate with all of the IP addresses to which that domain resolves</li> </ol>
Associated Test Case(s)	N/A
Associated Cybersecurity Framework Subcategory(ies)	ID.AM-1, ID.AM-2, ID.AM-3, PR.DS-5, DE.AE-1, PR.AC-4, PR.AC-5, PR.IP-1, PR.IP-3, PR.DS-2
IoT Device(s) Under Test	Raspberry Pi
MUD File(s) Used	<i>Yikesmain.json</i>
Preconditions	<ol style="list-style-type: none"> <li>1. The MUD PEP router/switch does not yet have any configuration settings pertaining to the IoT device being used in the test.</li> <li>2. The MUD file for the IoT device being used in the test is identical to the MUD file provided in Section 3.1.3. (Therefore, the MUD file used in the test permits the device to send data to <i>www.updateserver.com</i>.)</li> </ol>

Test Case Field	Description
	<ol style="list-style-type: none"> <li>3. The tester has access to a DNS server that will be used by the MUD PEP router/switch and can configure it so that it will resolve the domain <i>www.updateserver.com</i> to any of these addresses when queried by the MUD PEP router/switch: x1.x1.x1.x1, y1.y1.y1.y1, and z1.z1.z1.z1.</li> <li>4. There is an update server running at each of these three IP addresses.</li> </ol>
Procedure	<ol style="list-style-type: none"> <li>1. Verify that the MUD PEP router/switch for the IoT device to be used in the test does not yet have any configuration settings installed with respect to the IoT device being used in the test.</li> <li>2. Run test IoT-1-v4 (or IoT-1-v6). The result should be that the MUD PEP router/switch has been configured to explicitly permit the IoT device to initiate communication with <i>www.updateserver.com</i>.</li> <li>3. Verify that the MUD PEP router/switch has been configured with ACLs that permit the IoT device to send data to IP addresses x1.x1.x1.x1, y1.y1.y1.y1, and z1.z1.z1.z1.</li> <li>4. Have the device in question attempt to connect to x1.x1.x1.x1, y1.y1.y1.y1, and z1.z1.z1.z1.</li> </ol>
Expected Results	<p>The MUD PEP router/switch for the IoT device has had its configuration changed, i.e., it has been configured to permit the IoT device to send data to IP addresses x1.x1.x1.x1, y1.y1.y1.y1, and z1.z1.z1.z1.</p> <p>The IoT device is permitted to send data to each of the update servers at these addresses.</p>
Actual Results	<p><b>Procedures 1–2:</b>  <b>Completed; excluded for brevity</b></p> <p><b>Procedure 3:</b>  <b>MUD MANAGER:</b>  2019-07-15 20:28:32 DEBUG::GENERAL::2019-07-15T20:28:31Z NEW Wired DHCP 1,28,2,3,15,6,119,12,44,47,26,121,42 MUD <a href="https://mudfiles.nist.getyikes.com/yikesmain.json - b8:27:eb:eb:6c:8b 192.168.20.222 main-pi-Build2 ">https://mudfiles.nist.getyikes.com/yikesmain.json - b8:27:eb:eb:6c:8b 192.168.20.222 main-pi-Build2 </a>  2019-07-15 20:28:32 DEBUG::GENERAL::Executing on dhcpmasq info  2019-07-15 20:28:32 INFO::GENERAL::NEW Device Action: IP:</p>

Test Case Field	Description
	
Overall Results	Pass

Test case IoT-9-v6 is identical to test case IoT-9-v4 except that IoT-9-v6 uses IPv6 addresses rather than IPv4 addresses.

### 3.1.2.10 Test Case IoT-10-v4

**Table 3-11: Test Case IoT-10-v4**

Test Case Field	Description
Parent Requirements	(CR-12) The IoT DDoS example implementation shall include a MUD manager that uses a cached MUD file rather than retrieve a new one if the cache-validity time period has not yet elapsed for the MUD file indicated by the MUD URL. The MUD manager should fetch a new MUD file if the cache-validity time period has already elapsed.
Testable Requirements	<p>(CR-12.a) The MUD manager shall check if the file associated with the MUD URL is present in its cache and shall determine that it is.</p> <p>(CR-12.a.1) The MUD manager shall check whether the amount of time that has elapsed since the cached file was retrieved is less than or equal to the number of hours in the cache-validity value for this MUD file. If so, the MUD manager shall apply the contents of the cached MUD file.</p> <p>(CR-12.a.2) The MUD manager shall check whether the amount of time that has elapsed since the cached file was retrieved is greater than the number of hours in the cache-validity value for this MUD file. If so, the MUD manager may (but does not have to) fetch a new file by using the MUD URL received.</p>
Description	Shows that, upon connection to the network, a MUD-enabled IoT device used in the IoT DDoS example implementation has its MUD PEP router/switch automatically configured to enforce the route filtering that is described in the cached MUD file for that device's MUD URL, assuming that the amount of time that has elapsed since the cached MUD file was retrieved is less than or equal to the number of hours in the file's cache-validity value. If the cache validity has expired for the respective file, the MUD manager should fetch a new MUD file from the MUD file server.
Associated Test Case(s)	N/A

Test Case Field	Description
Associated Cybersecurity Framework Subcategory(ies)	ID.AM-1, ID.AM-2, ID.AM-3, PR.DS-5, DE.AE-1, PR.AC-4, PR.AC-5, PR.IP-1, PR.IP-3, PR.DS-2, PR.PT-3
IoT Device(s) Under Test	To be determined (TBD) (Not testable in Build 2's preproduction of Yikes!)
MUD File(s) Used	TBD (Not testable in Build 2's preproduction of Yikes!)
Preconditions	<ol style="list-style-type: none"> <li>1. The MUD PEP router/switch does not yet have any configuration settings pertaining to the IoT device being used in the test.</li> <li>2. The MUD file for the IoT device being used in the test is identical to the MUD file provided in Section 3.1.3.</li> </ol>
Procedure	<p>Verify that the MUD PEP router/switch for the IoT device to be used in the test does not yet have any configuration settings installed with respect to the IoT device being used in the test.</p> <ol style="list-style-type: none"> <li>1. Run test IoT-1-v4 (or IoT-1-v6).</li> <li>2. Within 24 hours (i.e., within the cache-validity period for the MUD file) of running test IoT-1-v4 (or IoT-1-v6), verify that the IoT device that was connected during test IoT-1-v4 (or IoT-1-v6) is still up and running on the network. Power on a second IoT device that has been configured to emit the same MUD URL as the device that was connected during test IoT-1-v4 (or IoT-1-v6), and connect it to the test network. This should set in motion the following series of steps, which should occur automatically.</li> <li>3. The IoT device automatically emits a DHCPv4 message containing the device's MUD URL (IANA code 161). (Note that in the v6 version of this test, IPv6, DHCPv6, and IANA code 112 will be used.)</li> <li>4. The DHCP server receives the DHCPv4 message containing the IoT device's MUD URL.</li> <li>5. The DHCP server offers an IP address lease to the newly connected IoT device.</li> </ol>

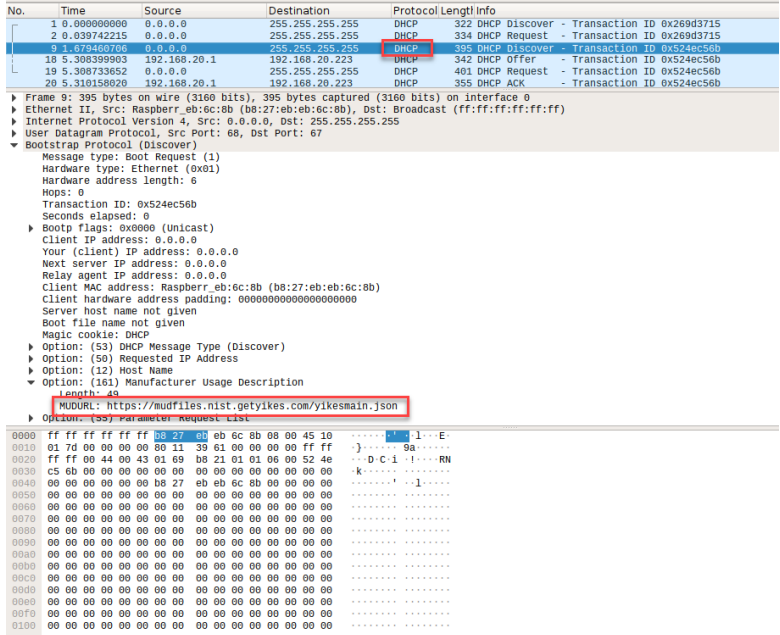

Test Case Field	Description
	<ol style="list-style-type: none"> <li>6. The IoT device requests this IP address lease, which the DHCP server acknowledges.</li> <li>7. The DHCP server sends the MUD URL to the MUD manager.</li> <li>8. The MUD manager determines that it has this MUD file cached and checks that the amount of time that has elapsed since the cached file was retrieved is less than or equal to the number of hours in the cache-validity value for this MUD file. If the cache validity has been exceeded, the MUD manager will fetch a new MUD file. (Run the test both ways—with a cache-validity period that has expired and with one that has not.)</li> <li>9. The MUD manager translates the MUD file’s contents into appropriate route filtering rules and installs these rules onto the MUD PEP for the IoT device in question so that this router/switch is now configured to enforce the policies specified in the MUD file.</li> </ol>
Expected Results	<p>The MUD PEP router/switch for the IoT device has had its configuration changed, i.e., it has been configured to enforce the policies specified in the IoT device’s MUD file. The expected configuration should resemble the following.</p> <p><b>Cache is valid</b> (the MUD manager does NOT retrieve the MUD file from the MUD file server):</p> <p>TBD (Not testable in Build 2’s preproduction of Yikes!)</p> <p><b>Cache is not valid</b> (the MUD manager does retrieve the MUD file from the MUD file server):</p> <p>TBD (Not testable in Build 2’s preproduction of Yikes!)</p> <p>All protocol exchanges described in steps 1–9 above are expected to occur and can be viewed via Wireshark if desired. If the router/switch does not get configured in accordance with the MUD file, each exchange of DHCP and MUD-related protocol traffic should be viewed on the network via Wireshark to determine which transactions did not proceed as expected, and the observed and absent protocol exchanges should be described here.</p>
Actual Results	TBD (Not testable in Build 2’s preproduction of Yikes!)
Overall Results	TBD (Not testable in Build 2’s preproduction of Yikes!)

Test case IoT-10-v6 is identical to test case IoT-10-v4 except that IoT-10-v6 tests requirement CR-1.a.2, whereas IoT-10-v4 tests requirement CR-1.a.1. Hence, as explained above, test IoT-10-v6 uses IPv6, DHCPv6, and IANA code 112 instead of using IPv4, DHCPv4, and IANA code 161.

### 3.1.2.11 Test Case IoT-11-v4

**Table 3-12: Test Case IoT-11-v4**

Test Case Field	Description
Parent Requirements	(CR-1) The IoT DDoS example implementation shall include a mechanism for associating a device with a MUD file URL (e.g., by having the MUD-enabled IoT device emit a MUD file URL via DHCP, LLDP, or X.509 or by using some other mechanism to enable the network to associate a device with a MUD file URL).
Testable Requirements	(CR-1.a) Upon initialization, the MUD-enabled IoT device shall broadcast a DHCP message on the network, including at most one MUD URL, in https scheme, within the DHCP transaction. (CR-1.a.1) The DHCP server shall be able to receive DHCPv4 DISCOVER and REQUEST with IANA code 161 (OPTION_MUD_URL_V4) from the MUD-enabled IoT device.
Description	Shows that the IoT DDoS example implementation includes IoT devices that can emit a MUD URL via DHCP
Associated Test Case(s)	N/A
Associated Cybersecurity Framework Subcategory(ies)	ID.AM-1
IoT Device(s) Under Test	Raspberry Pi
MUD File(s) Used	<i>Yikesmain.json</i>
Preconditions	Device has been developed to emit MUD URL in DHCP transaction

Test Case Field	Description
Procedure	<ol style="list-style-type: none"> <li>Power on a device and connect it to the network.</li> <li>Verify that the device emits a MUD URL in a DHCP transaction. (Use Wireshark to capture the DHCP transaction with options present.)</li> </ol>
Expected Results	DHCP transaction with MUD option 161 enabled and MUD URL included
Actual Results	<p><b>MUD option included in DHCP transaction:</b></p>  <p>The screenshot shows a Wireshark packet capture of a DHCP transaction. The packet list on the left shows several DHCP packets. The packet details pane on the right shows the details of a DHCP Offer (Transaction ID 0x524ec56b). The MUD option (161) is expanded, showing the MUDURL: <a href="https://mudfiles.nist.gov/yikes.com/yikesmain.json">https://mudfiles.nist.gov/yikes.com/yikesmain.json</a>.</p>
Overall Results	Pass

### 3.1.3 MUD Files

## 3.2 Demonstration of Non-MUD-Related Capabilities

In addition to supporting MUD, Build 2 supports capabilities with respect to device discovery, identification, categorization, and application of traffic rules based on device make and model. Table 2-13 lists the non-MUD-related capabilities that were demonstrated for Build 2. Before examining these capabilities, however, it is instructive to define terminology and provide an overview of Build 2's non-MUD-related capabilities.

### 3.2.1 Terminology

The terminology that is used to describe non-MUD capabilities is not standardized. To avoid confusion, we offer the following definitions for use in this section:

- Device discovery—detection that a device is on the network
- Device identity—an identifier that a build assigns to the device and uses to keep track of the device. In Build 2, when a device is discovered, it is assigned a unique identity.
- Device identification—determination of the device's make (i.e., manufacturer) and model. In Build 2, each make and model combination may be associated with internet traffic rules that, if present, will be applied to all devices having that same make and model.
- Category—a predefined class to which devices are assigned based on their make and model. Each category is associated with traffic rules (for both local traffic and internet traffic) that will be applied to all devices in that category.
- Device categorization—determination of which of the build's predefined categories to which to assign the device. The device's make and model determine its category, e.g., if the device is determined to be a Samsung Galaxy S8, it is placed in the phone category.
- Traffic policy—a set of traffic rules that may be associated with a category of devices or a set of devices having the same make and model; the traffic policy determines to what other local devices and remote domains these devices are permitted to initiate communication.

### 3.2.2 General Overview of Build 2's Non-MUD Functionality

Once Build 2 discovers a device on the network, it applies the following non-MUD capabilities to it:

- automatic (if possible) identification of the device's make (i.e., manufacturer) and model

- categorization of the device based on its make and model
- association of the device category with a traffic policy that indicates what communication devices in that category are permitted to initiate. This policy consists of rules that apply to both local and internet communications. The rules in this policy can be viewed using the Yikes! User Interface (UI). By selecting the specific category (e.g., “cellphone” or “computer”) on the UI Categories page, one can see two categories of rules, Local Network and Internet:
  - Internet rules that may be set to either
    - Allow All Internet Traffic, which indicates that all devices in this category are permitted to initiate communications to all internet domains
  - or
  - IoT Specific Sites, which indicates that there may be additional rules configured on the router that apply to specific makes and models of devices in this category and that restrict the internet sites to which those devices are permitted to initiate communications. (These per-make-and-model rules are stored in the cloud and viewed using the Yikes! UI. The IoT Devices tab displays the list of domain names to which communications may be initiated. For this version of the Yikes! cloud, these rules were set manually based on Build 2 test cases.)
  - Local Network rules that may be set to either
    - Allow All, which, if set, indicates that devices in this category are permitted to initiate communications to all other devices on the local network
  - or
  - any combination of other categories (cell phones, printers, tablets, printers, etc.) These indicate the other categories of devices on the local network to which devices in this category are permitted to initiate communications.

### 3.2.3 Non-MUD-Related Functional Capabilities

Table 3-13 lists the non-MUD-related capabilities that were demonstrated for Build 2. We use the letter “Y” as a prefix for these functional capability identifiers in the table below because these capabilities are specific to Build 2, which uses Yikes! equipment.

**Table 3-13: Non-MUD-Related Functional Capabilities Demonstrated**

Functional Capability	Parent Capability	Subrequirement 1	Subrequirement 2	Exercise ID
Y-1	<b>Device Identification</b> —The device is detected, and its make and model are identified upon connection to the network.			
Y-1.a		The non-MUD-capable device's <b>make and model are correctly identified</b> based on some combination of information such as the device's media access control (MAC) address, DHCP header information, and lookup in repositories.		YnMUD-1-v4, Yn-MUD-1-v6
Y-1.b		The non-MUD-capable <b>device's make and model cannot be identified.</b>		YnMUD-1-v4, Yn-MUD-2-v6
Y-1.c		The non-MUD-capable <b>device's make and model can be assigned manually.</b>		YnMUD-2-v4, Yn-MUD-3-v6
Y-2	<b>Device Categorization</b> —The device is correctly categorized according to its type (e.g., phone, printer, computer, watch)			

Functional Capability	Parent Capability	Subrequirement 1	Subrequirement 2	Exercise ID
	upon connection to the network.			
Y-2.a		The non-MUD-capable <b>device is correctly categorized based on its make and model.</b>	The device make and model were determined using some combination of MAC address, DHCP header information, and lookup in repositories.	YnMUD-1-v4, YnMUD-1-v6
Y-2.b		The <b>make and model of the non-MUD-capable device cannot be determined.</b>	The non-MUD-capable <b>device is designated as uncategorized.</b>	YnMUD-1-v4, YnMUD-1-v6
Y-2.c		The non-MUD-capable <b>device's category can be assigned manually.</b>		YnMUD-2-v4, YnMUD-3-v6
Y-3	<b>Rules regarding initiation of (south-north) communications to internet sites by the non-MUD-capable device are enforced according to rules associated with the device's category and, possibly, its make and model.</b>			

Functional Capability	Parent Capability	Subrequirement 1	Subrequirement 2	Exercise ID
Y-3.a		The device's category has <b>the Allow All Internet Traffic rule set</b> (i.e., the IoT Specific Sites rule is not set).	The device will be <b>permitted to connect to any internet location</b> .	YnMUD-3-v4, YnMUD-3-v6
Y-3.b		The device's category has <b>the IoT Specific Sites rule set</b> , indicating that there may be <b>rules associated with specific makes and models of devices in this category</b> that further restrict the internet locations to which those devices are able to initiate communications.		
Y-3.b.1			There are <b>(south to north) rules associated with the device's make and model</b> , so the device will be <b>allowed to initiate communications with the internet sites permitted by those rules but prohibited from initiating communications to all other internet sites</b> .	YnMUD-3-v4, YnMUD-3-v6
Y-3.b.2			There are <b>no (south to north) rules associated with a device's make and model</b> , so that device will be <b>allowed to</b>	YnMUD-3-v4, YnMUD-3-v6

Functional Capability	Parent Capability	Subrequirement 1	Subrequirement 2	Exercise ID
			initiate communications with all internet sites.	
Y-3.c			There are <b>(north to south) rules associated with a device's make and model</b> , so that device will be <b>allowed to receive communications from the internet sites permitted by the rules but prohibited from receiving communications from all other internet sites</b> .	<b>N/A for IPv4</b> due to NAT
Y-3.d			There are <b>no (north to south) rules associated with a device's make and model</b> , so that device will be <b>allowed to receive communications from all internet sites</b> .	<b>N/A for IPv4</b> due to NAT
Y-4	<b>Lateral (east-west) communications</b> of the non-MUD-capable device to other devices on the local network are <b>enforced according to the policy associated with</b>			

Functional Capability	Parent Capability	Subrequirement 1	Subrequirement 2	Exercise ID
	the device's category.			
Y-4.a		A rule associated with the device's category <b>permits the device to initiate communications with local devices in category X, but there is no such rule that permits the device to initiate communications with local devices in category Y.</b>		YnMUD-4-v4, YnMUD-4-v6
Y-4.a.1			The device will be allowed to <b>initiate communications to</b> any local device that is in <b>category X.</b>	YnMUD-4-v4, YnMUD-4-v6
Y-4.a.2			The device will be <b>prohibited from initiating communications to</b> any local device that is in <b>category Y.</b>	YnMUD-4-v4, YnMUD-4-v6
Y-5	In response to threat information, all devices on the local network are prohibited from visiting specific domains and IP addresses.			

Functional Capability	Parent Capability	Subrequirement 1	Subrequirement 2	Exercise ID
Y-5.a		Threat intelligence indicates a <b>specific internet domain that should not be trusted</b> .	<b>Devices are prohibited from initiating communications to the internet domain listed in the threat intelligence. In addition, they are prohibited from initiating communications to any other domains and IP addresses that are associated with the same threat campaign as this domain.</b>	YnMUD-5-v4, YnMUD-5-v6
Y-5.b		Threat intelligence indicates a <b>specific IP address that should not be trusted</b> .	<b>Devices are prohibited from initiating communications to the IP address listed in the threat intelligence. In addition, they are prohibited from initiating communications to any other IP addresses and domains that are associated with the same threat campaign as this IP address.</b>	YnMUD-6-v4, YnMUD-6-v6
Y-5.c		Threat intelligence was received more than 24 hours prior, indicating domains and IP addresses that should not be trusted, and those domains and IP addresses were blocked by ACLs installed on the router.	<b>After 24 hours, these ACLs are no longer configured in the router.</b>	YnMUD-7-v4, YnMUD-7-v6

### 3.2.4 Exercises to Demonstrate the Above Non-MUD-Related Capabilities

This section contains the exercises that were performed to verify that Build 2 supports the non-MUD-related capabilities listed in Table 3-13.

To support these tests, the following domains must be available on the internet (i.e., outside the local network):

- [www.google.com](http://www.google.com)
- [www.osmud.org](http://www.osmud.org)
- [www.trytechy.com](http://www.trytechy.com)

#### 3.2.4.1 Exercise YnMUD-1-v4

**Table 3-14: Exercise YnMUD-1-v4**

Exercise Field	Description
Parent Capability	(Y-1) Device Identification—The device is detected, and its make and model are identified upon connection to the network. (Y-2) Device Categorization—The device is correctly categorized according to its type (e.g., phone, printer, computer, watch) upon connection to the network.
Subrequirement(s) of Parent Capability to Be Demonstrated	(Y-1.a) The non-MUD-capable device’s make and model are correctly identified based on some combination of information such as the device’s MAC address, DHCP header information, and lookup in repositories. (Y-2.a) The non-MUD-capable device is correctly categorized based on its make and model. The device make and model were determined using some combination of MAC address, DHCP header information, and lookup in repositories. (Y-1.b) The non-MUD-capable device’s make and model cannot be identified. (Y-2.b) The make and model of the non-MUD-capable device cannot be determined. The non-MUD-capable device is designated as uncategorized.
Description	Verify that upon detection, when possible, the make (i.e., manufacturer) and model of a non-MUD-capable device are identified correctly based

Exercise Field	Description
	on some combination of its MAC address, DHCP header information, and lookup through the Yikes! cloud service; the device is assigned to the correct category; and it is assigned a unique identity. In addition, verify that a non-MUD-capable device whose make and model cannot be determined will be assigned to the “uncategorized” category.
Associated Exercises	N/A
Associated Cybersecurity Framework Subcategory(ies)	ID.AM-1, ID.AM-2, ID.AM-3, DE.AE-1, DE.CM-1
IoT Device(s) Used	<ul style="list-style-type: none"> <li>- Laptop—with network-scanning software loaded</li> <li>- Cell phone—with network-scanning application loaded</li> <li>- Printer</li> <li>- Nest Camera to serve as an actual IoT device</li> <li>- Raspberry PI emulating an IoT device</li> </ul>
Policy Used	N/A
Preconditions	<p>The Yikes! router is installed on the local network and connected to the internet.</p> <p>The Yikes! account is set up and available to the user at <a href="https://nist.getyikes.com">https://nist.getyikes.com</a>.</p> <p>The IoT devices listed above are available to be connected to the local network.</p>
Procedure	<ol style="list-style-type: none"> <li>1. Use the Yikes! UI to determine whether any devices are present (either active or inactive) on the network.</li> <li>2. If any devices are present, they are to be deleted. Then verify that no devices are present (either active or inactive) on the network.</li> <li>3. Connect each of the five devices above to the local network.</li> <li>4. Validate that each device has appeared in Yikes! UI.</li> </ol>
Demonstrated Results	Access the Yikes! UI, go to the Devices page, click the ALL tab, and verify that the following information is present, showing that each device has

Exercise YnMUD-1-v6 is identical to exercise YnMUD-1-v4 except that it uses IPv6 instead of IPv4.

### 3.2.4.2 Exercise YnMUD-2-v4

**Table 3-15: Exercise YnMUD-2-v4**

Exercise Field	Description
Parent Capability	(Y-1) Device Identification—The device is detected, and its make and model are identified upon connection to the network. (Y-2) Device Categorization—The device is correctly categorized according to its type (e.g., phone, printer, computer, watch) upon connection to the network.
Subrequirement(s) of Parent Capability to Be Demonstrated	(Y-1.c) The non-MUD-capable device’s make and model can be assigned manually. (Y-2.c) The non-MUD-capable device’s category can be assigned manually.
Description	Verify that a non-MUD-capable device can have its make, model, or category assigned manually.
Associated Exercises	YnMUD-1-v4
Associated Cybersecurity Framework Subcategory(ies)	ID.AM-1, ID.AM-3
IoT Device(s) Used	Same as for exercise YnMUD-1-v4
Policy Used	N/A
Preconditions	Same as for exercise YnMUD-1-v4
Procedure	<ol style="list-style-type: none"> <li>1. Run exercise YnMUD-1-v4.</li> <li>2. Use the Yikes! UI to modify the make (i.e., manufacturer) of Device X to be Z Corp.</li> <li>3. Use the Yikes! UI to modify the model of Device X to be Model ABC.</li> <li>4. Use the Yikes! UI to modify the category of the cell phone to be Uncategorized.</li> </ol>

Exercise Field	Description																														
Demonstrated Results	<p>Access the Yikes! UI, go to the Device tab, and verify that the following information is present:</p> <p><b>Procedure 1: Completed; excluded for brevity</b></p> <p><b>Procedures 2–3:</b></p> <div><p>Operating System/Linux OS/Generic Linux 192_168_20_238 - 80:00:0B:EF:81:70 Z CORP : MODEL ABC. COMPUTERS</p></div> <p><b>Procedure 4:</b></p> <div><p>Phone, Tablet or Wearable/Apple Mobile Device/Apple iPhone/iphone IPHONE - 20:EE:28:99:E6:FA APPLE, INC. : IPHONE UNCATEGORIZED</p></div> <table><tr><th>Device</th><th>Device ID</th><th>Make</th><th>Model</th><th>Category</th></tr><tr><td>Laptop</td><td>ID_1</td><td>Dell</td><td>E6540</td><td>Computer</td></tr><tr><td>Cell Phone</td><td>ID_2</td><td>Apple</td><td>iPhone7</td><td>Cell phone</td></tr><tr><td>Printer</td><td>ID_3</td><td>Canon</td><td>MX922</td><td>Uncategorized</td></tr><tr><td>Camera</td><td>ID_4</td><td>Nest</td><td>Indoor Cam</td><td>Smart Appliances</td></tr><tr><td>Test-PI</td><td>ID_5</td><td>Raspberry</td><td>Pi B+</td><td>Computer</td></tr></table>	Device	Device ID	Make	Model	Category	Laptop	ID_1	Dell	E6540	Computer	Cell Phone	ID_2	Apple	iPhone7	Cell phone	Printer	ID_3	Canon	MX922	Uncategorized	Camera	ID_4	Nest	Indoor Cam	Smart Appliances	Test-PI	ID_5	Raspberry	Pi B+	Computer
Device	Device ID	Make	Model	Category																											
Laptop	ID_1	Dell	E6540	Computer																											
Cell Phone	ID_2	Apple	iPhone7	Cell phone																											
Printer	ID_3	Canon	MX922	Uncategorized																											
Camera	ID_4	Nest	Indoor Cam	Smart Appliances																											
Test-PI	ID_5	Raspberry	Pi B+	Computer																											

Exercise YnMUD-2-v6 is identical to exercise YnMUD-2-v4 except that it uses IPv6 instead of IPv4.

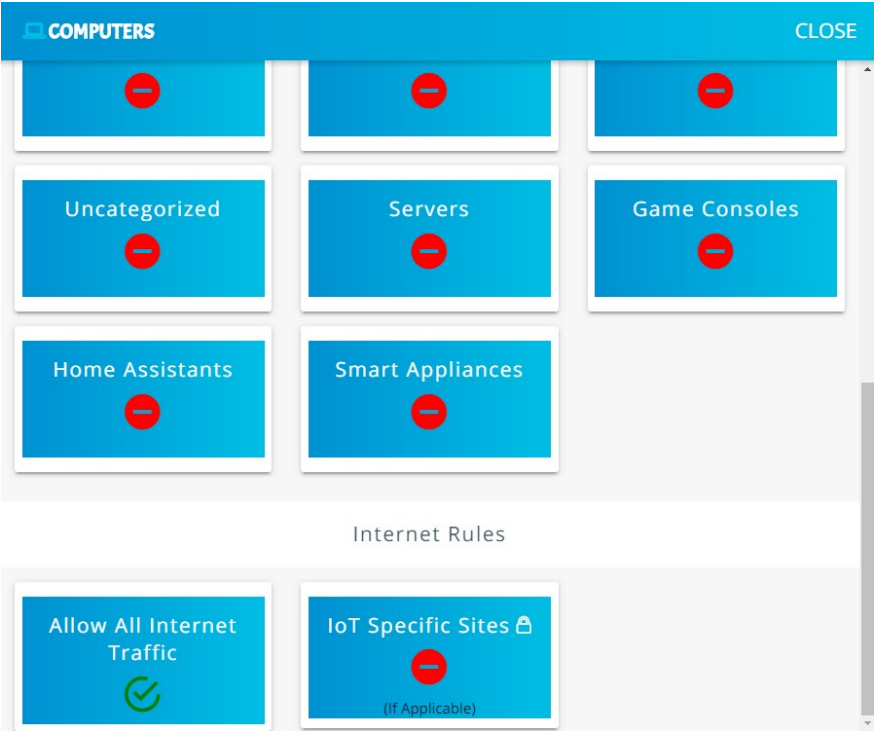

### 3.2.4.3 Exercise YnMUD-3-v4

**Table 3-16: Exercise YnMUD-3-v4**

Exercise Field	Description
Parent Capability	(Y-3) Rules regarding initiation of (south-north) communications to internet sites by the non-MUD-capable device are enforced according to

Exercise Field	Description
	rules associated with the device's category and, possibly, its make and model.
Subrequirement(s) of Parent Capability to Be Demonstrated	<p>(Y-3.a) The device's category has the Allow All Internet Traffic rule set (i.e., the IoT Specific Sites rule is not set). The device will be permitted to connect to any internet location.</p> <p>(Y-3.b) The device's category has the IoT Specific Sites rule set, indicating that there may be rules associated with specific makes and models of devices in this category that further restrict the internet locations to which those devices are able to initiate communications.</p> <p>(Y-3.b.1) There are (south to north) rules associated with the device's make and model, so the device will be allowed to initiate communications with the internet sites permitted by those rules but prohibited from initiating communications to all other internet sites.</p> <p>(Y-3.b.2) There are no (south to north) rules associated with a device's make and model, so that device will be allowed to initiate communications with all internet sites.</p>
Description	<p>Verify that once a device has been categorized, the device will be able to initiate communications to internet sites as constrained by any south-to-north rules that may be in place on the router that pertain to the device's make and model. In particular:</p> <ul style="list-style-type: none"> <li>- If the IoT Specific Sites rule is not set for the device's category, the device will be permitted to initiate communication with all internet sites.</li> <li>- If the IoT Specific Sites rule is set for this device's category and there are south-to-north rules on the router that apply to the device's make and model, the device will be restricted to initiating communications to only those internet sites permitted by those rules on the router.</li> <li>- If the IoT Specific Sites rule is set for this device's category but there are no south-to-north rules on the router that apply to the device's make and model, the device will not be permitted to initiate communication with any internet sites.</li> </ul>
Associated Exercises	N/A

Exercise Field	Description
Associated Cybersecurity Framework Subcategory(ies)	ID.AM-3, ID.AM-4, PR.AC-1, PR.AC-3, PR.AC-4, PR.AC-5
IoT Device(s) Used	<ul style="list-style-type: none"> <li>- Laptop</li> <li>- iPhone 7 cell phone</li> <li>- Raspberry Pi</li> </ul>
Policy Used	<p>In the Yikes! UI, the Smart Appliances and Cell Phone internet rule is set to IoT Specific Sites. On the router, one ACL rule applies to the Raspberry Pi that permits it to visit <a href="http://www.getyikes.com">www.getyikes.com</a> and <a href="http://www.osmud.org">www.osmud.org</a>, but there are no device-specific rules that apply to cell phones. On the router, there are no rules that apply to iPhone 7 devices.</p> <p>In the Yikes! UI, the Computer internet rule is set to Allow All Internet Traffic rather than to IoT Specific Sites.</p>
Preconditions	<p>The Smart Appliance, Cell Phone, and Computer category rules in the Yikes! UI and the ACL rules on the router are configured as described in the policy row above. (The presence of the Smart Appliances, Cell Phone, and Computer category rules can be verified by accessing the Yikes! UI. Using the UI, we should also be able to see the fully qualified domain names [FQDNs] of the sites that the rules permit each make and model of connected appliance and cell phone to access if any exist. The presence of the ACL rules can be verified only by logging in to the router.)</p>
Procedure	<ol style="list-style-type: none"> <li>1. Validate Yikes! UI configuration for Smart Appliances, Cell Phone, and Computer categories.</li> <li>2. Connect the iPhone 7, Raspberry Pi, and laptop to the network.</li> <li>3. Validate that the Raspberry Pi can browse to <a href="http://www.osmud.org">www.osmud.org</a> and <a href="http://www.getyikes.com">www.getyikes.com</a> but not to <a href="http://www.google.com">www.google.com</a>.</li> <li>4. Validate that the iPhone 7 cannot browse to <a href="http://www.google.com">www.google.com</a>, <a href="http://www.osmud.org">www.osmud.org</a>, and <a href="http://www.getyikes.com">www.getyikes.com</a>.</li> <li>5. Validate that a computer on the network can browse to <a href="http://www.google.com">www.google.com</a>, <a href="http://www.osmud.org">www.osmud.org</a>, and <a href="http://www.getyikes.com">www.getyikes.com</a>.</li> </ol>

Exercise Field	Description
	<p>6. Log in to the router to validate that the appropriate ACL rules are in place.</p>
Demonstrated Results	<p>Cell phone access is permitted and prohibited as expected in the procedure steps above. Computer access is permitted as expected.</p> <p><b>Procedure 1:</b></p> <p><b>Computers</b></p>  <p><b>Cell Phones</b></p>

As explained above, exercise YnMUD-3-v6 is identical to exercise YnMUD-3-v4 except that it uses IPv6 instead of IPv4.

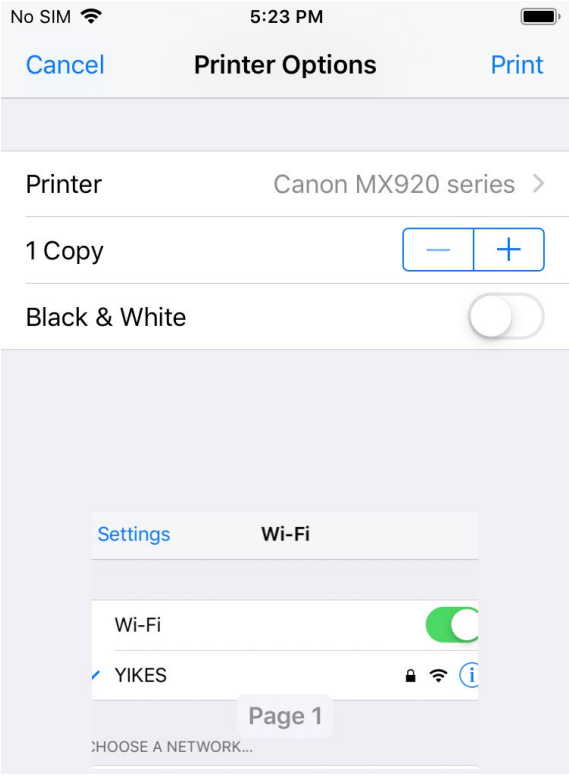

#### 3.2.4.4 Exercise YnMUD-4-v4

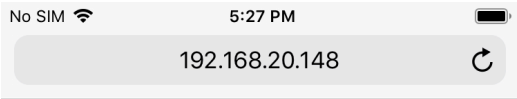

**Table 3-17: Exercise YnMUD-4-v4**

Exercise Field	Description
Parent Capability	(Y-4) Lateral (east-west) communications of the non-MUD-capable device to other devices on the local network are enforced according to the policy associated with the device's category.
Subrequirement(s) of Parent Capability to Be Demonstrated	(Y-4.a) A rule associated with the device's category permits the device to initiate communications with local devices in category X, but there is no such rule that permits the device to initiate communications with local devices in category Y. (Y-4.a.1) The device will be allowed to initiate communications to any local device that is in category X. (Y-4.a.2) The device will be prohibited from initiating communications to any local device that is in category Y.
Description	Verify that once a device has been identified and categorized, the communications that it initiates to other devices on the local network will be restricted according to the local network (east-west) rules in place for the device's category.
Associated Exercises	YnMUD-1-v4

Exercise Field	Description
Associated Cybersecurity Framework Subcategory(ies)	ID.AM-3, ID.AM-4, PR.AC-1, PR.AC-3, PR.AC-4, PR.AC-5
IoT Device(s) Used	Same as for exercise YnMUD-1-v4
Policy Used	<p>In the Yikes! UI:</p> <ul style="list-style-type: none"> <li>- The Cell Phone local rules are set to allow cell phones to initiate communications to printers but not to any other category of devices.</li> <li>- The Computer local rules are set to allow computers to initiate communications to all other devices.</li> <li>- The Printer local rules are set to deny printers from initiating communications to all other devices.</li> </ul>
Preconditions	<p>Same as for exercise YnMUD-1-v4. In addition, the device category rules are as described in the policy row above (the presence of these rules can be verified by accessing the Yikes! UI).</p> <p>Add several devices to the Printer and Laptop categories.</p>
Procedure	<ol style="list-style-type: none"> <li>1. Execute the procedures defined in exercise YnMUD-1-v4 and verify that the exercise has achieved the expected results (all IoT devices have had their make and model identified, if possible, and they have all been categorized correctly).</li> <li>2. Verify that the cell phone can print a file successfully.</li> <li>3. Verify that the cell phone cannot communicate with the connected appliance.</li> <li>4. Recategorize a Raspberry Pi as a printer.</li> <li>5. Verify that the Raspberry Pi cannot communicate with the laptop.</li> <li>6. Verify that the laptop can send traffic to each of the other devices.</li> </ol>
Demonstrated Results	<p>When using the scanning software on the phone and laptop, only the devices that we expected to see in the procedural steps above could be seen.</p> <p><b>Procedure 1: Completed; excluded for brevity</b></p>

Exercise Field	Description
	<p><b>Procedure 2:</b></p>  <p><b>Procedure 3:</b></p>

Exercise Field	Description
	<div data-bbox="553 428 1066 525">  </div> <p data-bbox="646 695 976 779">Safari cannot open the page because it could not connect to the server.</p> <hr/> <p data-bbox="553 919 708 945"><b>Procedure 4:</b></p> <div data-bbox="553 953 1206 1079">  <p>Operating System/Linux OS/Gentoo Linux  MY-CONTROLLER-PI - B8:27:EB:2B:39:B1  RASPBERRY PI FOUNDATION : GENTOO LINUX  PRINTERS</p> </div> <hr/> <p data-bbox="553 1119 708 1144"><b>Procedure 5:</b></p> <pre data-bbox="553 1157 1227 1234">pi@my-controller-pi:~ \$ wget 192.168.20.238 --2019-07-24 18:13:12-- http://192.168.20.238/</pre> <p data-bbox="553 1257 1313 1312"><b>Connecting to 192.168.20.238:80... failed: Connection refused.</b></p> <hr/> <p data-bbox="553 1373 708 1398"><b>Procedure 6:</b></p> <p data-bbox="553 1417 756 1442">Laptop to printer</p> <pre data-bbox="553 1455 1398 1724">[mud@localhost ~]\$ wget 192.168.20.232 --2019-07-24 13:44:14-- http://192.168.20.232/ Connecting to 192.168.20.232:80... connected. As explained above, exercise YnMUD-4-v6 is identical to exercise YnMUD-4-v4 except that it uses IPv6 instead of IPv4.

### 3.2.4.5 Exercise YnMUD-5-v4

**Table 3-18: Exercise YnMUD-5-v4**

Exercise Field	Description
Parent Capability	(Y-5) In response to threat information, all devices on the local network are prohibited from visiting specific domains and IP addresses.
Subrequirement(s) of Parent Capability to Be Demonstrated	(Y-5.a) Threat intelligence indicates a specific internet domain that should not be trusted. Devices are prohibited from initiating communications to the internet domain listed in the threat intelligence. In addition, they are prohibited from initiating communications to any other domains and IP addresses that are associated with the same threat campaign as this domain.

Exercise Field	Description
Description	Verify that when threat signaling information indicates that a specific domain is not safe, all devices on the local network will be restricted from initiating communications to that domain as well as to all other domains and IP addresses that are associated with the same threat campaign as this domain.
Associated Exercises	YnMUD-3-v4
Associated Cybersecurity Framework Subcategory(ies)	ID.RA-2, ID.RA-3, PR.AC-3, PR.AC-4, PR.AC-5
IoT Device(s) Used	Use the same non-MUD-capable devices as for exercise YnMUD-3-v4: <ul style="list-style-type: none"> <li>- laptop</li> <li>- Samsung Galaxy S8 cell phone</li> <li>- iPhone 7 cell phone</li> </ul>
Policy Used	Use the same (non-MUD) Yikes! router policy as for exercise YnMUD-3-v4, specifically: In the Yikes! UI, the Computer internet rule is set to Allow All Internet Traffic rather than to IoT Specific Sites.
Preconditions	Threat signaling is enabled. Threat signaling intelligence indicates that internet domain <i>www.dangerousSite.org</i> is dangerous and devices shall be prohibited from visiting it. It also associates <i>www.dangerousSite1.org</i> with the same threat campaign as <i>www.dangerousSite.org</i> , and these domains are associated with IP addresses XX.XX.XX.XX and YY.YY.YY.YY. In addition, the other preconditions are the same as for exercise YnMUD-3-v4, specifically: The Computer category internet rule in the Yikes! UI is set to Allow All Internet Traffic rather than to IoT Specific Sites. Therefore, the ACL rules on the router are configured to permit the laptop to send traffic to any site.

Exercise Field	Description
Procedure	<ol style="list-style-type: none"> <li>1. Log in to the router and verify that there is no ACL that prohibits visiting <i>www.dangerousSite.org</i>, <i>www.dangerousSite1.org</i>, or IP addresses XX.XX.XX.XX or YY.YY.YY.YY.</li> <li>2. Run exercise YnMUD-3-v4 and verify that it has the expected results, i.e., verify that the laptop can browse to <i>www.google.com</i>, <i>www.osmud.org</i>, and <i>www.getyikes.com</i>.</li> <li>3. At this point, the test has verified that the Yikes! router rules are being enforced as expected. Now test the threat signaling capability by using the laptop to try to browse to a site that is prohibited by the threat signaling information: <i>www.dangerousSite.org</i>.</li> <li>4. Verify that the laptop is not permitted to connect to this site.</li> <li>5. Verify that firewall rules corresponding to the threat response have been installed on the router, prohibiting communication with <i>www.dangerousSite.org</i>, <i>www.dangerousSite1.org</i>, and IP addresses XX.XX.XX.XX and YY.YY.YY.YY.</li> </ol>
Demonstrated Results	<p>With threat signaling enabled, the laptop is prohibited from initiating communications to domains flagged by threat signaling.</p> <p><b>Procedure 1:</b></p> <pre> config defaults option syn_flood 1 option input ACCEPT option output ACCEPT option forward REJECT # Uncomment this line to disable ipv6 rules # option disable_ipv6 1  config zone option name lan list network 'lan' option input ACCEPT option output ACCEPT option log '1'  config zone option name wan list network 'wan' list network 'wan6' option input REJECT option output ACCEPT option forward REJECT </pre>

As explained above, exercise YnMUD-5-v6 is identical to exercise YnMUD-5-v4 except that it uses IPv6 instead of IPv4.

### 3.2.4.6 Exercise YnMUD-6-v4

**Table 3-19: Exercise YnMUD-6-v4**

Exercise Field	Description
Parent Capability	(Y-5) In response to threat information, all devices on the local network are prohibited from visiting specific domains and IP addresses.
Subrequirement(s) of Parent Capability to Be Demonstrated	(Y-5.b) Threat intelligence indicates a specific IP address that should not be trusted. Devices are prohibited from initiating communications to the IP address listed in the threat intelligence. In addition, they are prohibited from initiating communications to any other IP addresses and domains that are associated with the same threat campaign as this IP address.
Description	Verify that when threat signaling information indicates that a specific IP address (as opposed to domain) is not safe, all devices on the local network will be restricted from initiating communications to that IP address as well as to all other IP addresses and domains that are associated with the same threat campaign as this IP address.
Associated Exercises	YnMUD-3-v4
Associated Cybersecurity Framework Subcategory(ies)	ID.RA-2, ID.RA-3, PR.AC-3, PR.AC-4, PR.AC-5
IoT Device(s) Used	Use the same non-MUD-capable devices as for exercise YnMUD-3-v4: <ul style="list-style-type: none"> <li>- laptop</li> <li>- Samsung Galaxy S8 cell phone</li> <li>- iPhone 7 cell phone</li> </ul>
Policy Used	Use the same (non-MUD) Yikes! router policy as for exercise YnMUD-3-v4, specifically: In the Yikes! UI, the Computer internet rule is set to Allow All Internet Traffic rather than to IoT Specific Sites.

Exercise Field	Description
Preconditions	<p>Threat signaling is enabled. Threat signaling intelligence indicates that IP address XX.XX.XX.XX is dangerous, and devices shall be prohibited from visiting it. It also associates IP address YY.YY.YY.YY with the same threat campaign as IP address XX.XX.XX.XX and these IP addresses are associated with domains <i>www.dangerousSite.org</i> and <i>www.dangerousSite1.org</i>.</p> <p>In addition, the other preconditions are the same as for exercise YnMUD-3-v4, specifically:</p> <p>The Computer category internet rule in the Yikes! UI is set to Allow All Internet Traffic rather than to IoT Specific Sites. Therefore, the firewall rules on the router are configured to permit the laptop to send traffic to any site.</p>
Procedure	<ol style="list-style-type: none"> <li>1. Log in to the router and verify that there is no ACL that prohibits visiting IP address XX.XX.XX.XX, IP address YY.YY.YY.YY, <i>www.dangerousSite.org</i>, or <i>www.dangerousSite1.org</i> (where IP address XX.XX.XX.XX is an address that is associated with the same threat as <i>www.dangerousSite.org</i>).</li> <li>2. Run exercise YnMUD-3-v4 and verify that it has the expected results, i.e., verify that the laptop can browse to <i>www.google.com</i>, <i>www.osmud.org</i>, and <i>www.trytechy.com</i>.</li> <li>3. At this point, the test has verified that the Yikes! router rules are being enforced as expected.</li> <li>4. Run exercise YnMUD-5-v4. As a result, there should now be firewall rules on the router that prohibit all devices on the network from communicating with all domains and IP addresses that are associated with the same threat as the domain <i>www.dangerousSite.org</i>.</li> <li>5. Use the laptop to try to browse to one of the IP addresses that is associated with the same threat as <i>www.dangerousSite.org</i>: IP address XX.XX.XX.XX.</li> <li>6. Verify that the laptop is not permitted to connect to this site.</li> <li>7. Verify that firewall rule corresponding to the threat response has been installed on the router, prohibiting communication with <i>www.dangerousSite.org</i>, <i>www.dangerousSite1.org</i>, and IP addresses XX.XX.XX.XX and YY.YY.YY.YY.</li> </ol>

Exercise Field	Description
Demonstrated Results	<p>With threat signaling enabled, the laptop is prohibited from initiating communications to IP addresses flagged by threat signaling intelligence.</p> <p><b>Procedures 1–3:</b> <b>Completed; excluded for brevity</b></p> <p><b>Procedure 4:</b> <b>Laptop ping <i>www.dangerousSite.org</i></b></p> <pre> NCCoEs-MBP:results nccoe\$ ping www.dangerousSite.org PING www.dangerousSite.org(127.0.0.1): 56 data bytes 64 bytes from 127.0.0.1: icmp_seq=0 ttl=64 time=0.039 ms 64 bytes from 127.0.0.1: icmp_seq=1 ttl=64 time=0.136 ms 64 bytes from 127.0.0.1: icmp_seq=2 ttl=64 time=0.063 ms 64 bytes from 127.0.0.1: icmp_seq=3 ttl=64 time=0.141 ms 64 bytes from 127.0.0.1: icmp_seq=4 ttl=64 time=0.071 ms ^C --- www.dangerousSite.org ping statistics --- 5 packets transmitted, 5 packets received, 0.0% packet loss round-trip min/avg/max/stddev = 0.039/0.090/0.141/0.041 ms NCCoEs-MBP:results nccoe\$  NCCoEs-MBP:results nccoe\$ ping 192.60.252.130 PING 192.60.252.130 (192.60.252.130): 56 data bytes Request timeout for icmp_seq 0 Request timeout for icmp_seq 1 Request timeout for icmp_seq 2 Request timeout for icmp_seq 3 ^C --- 192.60.252.130 ping statistics --- 5 packets transmitted, 0 packets received, 100.0% packet loss NCCoEs-MBP:results nccoe\$ </pre> <p><b>Procedure 5:</b></p> <pre> # Q9THREATRULES start # # DO NOT EDIT THESE LINES. As explained above, exercise YnMUD-6-v6 is identical to exercise YnMUD-6-v4 except that it uses IPv6 instead of IPv4.

### 3.2.4.7 Exercise YnMUD-7-v4

**Table 3-20: Exercise YnMUD-7-v4**

Exercise Field	Description
Parent Capability	(Y-5) In response to threat information, all devices on the local network are prohibited from visiting specific domains and IP addresses.

Exercise Field	Description
Subrequirement(s) of Parent Capability to Be Demonstrated	(Y-5.c) Threat intelligence was received more than 24 hours prior, indicating domains and IP addresses that should not be trusted, and those domains and IP addresses were blocked by ACLs installed on the router. After 24 hours, these ACLs have been removed from the router.
Description	Verify that 24 or more hours after ACLs have been installed on the router as a result of threat signaling intelligence, those ACLs will be removed.
Associated Exercises	YnMUD-5-v4 and YnMUD-6-v4
Associated Cybersecurity Framework Subcategory(ies)	ID.RA-2, ID.RA-3, PR.AC-3, PR.AC-4, PR.AC-5
IoT Device(s) Used	Same as for tests YnMUD-5-v4 and YnMUD-6-v4
Policy Used	Same as the policy used for tests YnMUD-3-v4, YnMUD-5-v4, and YnMUD-6-v4
Preconditions	Threat signaling is enabled. Threat signaling intelligence indicates that <a href="http://www.dangerousSite.org">www.dangerousSite.org</a> , <a href="http://www.dangerousSite1.org">www.dangerousSite1.org</a> , and IP addresses XX.XX.XX.XX and YY.YY.YY.YY are dangerous, and devices shall be prohibited from visiting them.
Procedure	<p>Run test YnMUD-5-v4 and verify that the laptop is not permitted to access <a href="http://www.dangerousSite.org">www.dangerousSite.org</a>, <a href="http://www.dangerousSite1.org">www.dangerousSite1.org</a>, and IP addresses XX.XX.XX.XX and YY.YY.YY.YY.</p> <p>Log on to the router and verify that ACLs have been installed on it prohibiting communication with <a href="http://www.dangerousSite.org">www.dangerousSite.org</a>, <a href="http://www.dangerousSite1.org">www.dangerousSite1.org</a>, and IP addresses XX.XX.XX.XX and YY.YY.YY.YY.</p> <p>Let 24 hours elapse.</p> <p>Log on to the router and verify that the ACLs that had prohibited communication with <a href="http://www.dangerousSite.org">www.dangerousSite.org</a>, <a href="http://www.dangerousSite1.org">www.dangerousSite1.org</a>, and IP addresses XX.XX.XX.XX and YY.YY.YY.YY are no longer there.</p>

Exercise Field	Description
Demonstrated Results	<p>ACL rules that had been installed as a result of threat signaling intelligence were removed after 24 hours.</p> <p><b>Procedure 1:</b></p> <p><b>Completed; see YnMUD-6-v4</b></p> <p><b>Procedure 2:</b></p> <pre># Q9THREATRULES start # # DO NOT EDIT THESE LINES. Exercise Field	Description
	<pre> # Q9THREATRULES end # OSMUD start  <b>Procedure 4:</b>  root@OpenWrt:~# cat /etc/config/firewall config defaults     option syn_flood      1     option input          ACCEPT     option output          ACCEPT     option forward        REJECT # Uncomment this line to disable ipv6 rules #    option disable_ipv6 1  config zone     option name            lan     list network           'lan'     option input           ACCEPT     option output          ACCEPT     option log '1'  config zone     option name            wan     list network           'wan'     list network           'wan6'     option input           REJECT     option output          ACCEPT     option forward        REJECT     option masq            1     option mtu_fix         1     option log '1'  config forwarding     option src             lan     option dest            wan  # We need to accept udp packets on port 68, # see <a href="https://dev.openwrt.org/ticket/4108">https://dev.openwrt.org/ticket/4108</a> config rule     option name            Allow-DHCP-Renew     option src             wan     option proto            udp     option dest_port       68     option target           ACCEPT     option family           ipv4  # Allow IPv4 ping config rule     option name            Allow-Ping     option src             wan </pre>

Exercise Field	Description
	<pre> option proto      icmp option icmp_type  echo-request option family     ipv4 option target     ACCEPT  config rule option name       Allow-IGMP option src        wan option proto      igmp option family     ipv4 option target     ACCEPT  <b>[Omitted for brevity]</b>  # Q9THREATRULES start # # DO NOT EDIT THESE LINES. Q9THRT WILL REPLACE WITH ITS CON- # FIGURATION # # Q9THREATRULES end # OSMUD start # # DO NOT EDIT THESE LINES. OSMUD WILL REPLACE WITH ITS CON- # FIGURATION #  <b>[Omitted for brevity]</b>  # OSMUD end # AYIKES start # # DO NOT EDIT THESE LINES. AYIKES WILL REPLACE WITH ITS CON- # FIGURATION #  # Begin YIKES ipset firewall declarations  <b>[Omitted for brevity]</b>  # AYIKES end </pre>

As explained above, exercise YnMUD-7-v6 is identical to exercise YnMUD-7-v4 except that it uses IPv6 instead of IPv4.

## 4 Build 3

Build 3 uses equipment and cloud resources from CableLabs. The CableLabs Micronets Gateway on the local network; a cloud-based micro-services layer that hosts various Micronets services (e.g., software-defined networking [SDN] controller, Micronets Manager, MUD manager, configuration micro-service, identity server [optional], and DHCP/DNS configuration services) and a mobile application are used to perform IoT device onboarding via the Wi-Fi Easy Connect protocol and to manage and enforce trust domains on the local network, as well as support MUD. (Note that another name for the Wi-Fi Easy Connect protocol is Device Provisioning Protocol [DPP]. Throughout the remainder of this document, we use the term DPP for conciseness.)

### 4.1 Evaluation of MUD-Related Capabilities

The functional evaluation that was conducted to verify that Build 3 conforms to the MUD specification was based on the Build-3-specific requirements listed in Table 4-1.

#### 4.1.1 Requirements

**Table 4-1: MUD Use Case Functional Requirements**

Capability Requirement (CR)-ID	Parent Requirement	Subrequirement 1	Subrequirement 2	Test Case
CR-1	The IoT DDoS example implementation shall include a mechanism for associating a device with a MUD file (e.g., by having the MUD-enabled IoT device emit a MUD file URL via DHCP, LLDP, or X.509 or by using some other mechanism to enable the network to associate a device with a MUD file).			IoT-1-v4, IoT-11-v4
CR-1.a		The device's MUD file is located by using two items in the device's bootstrapping		IoT-1-v4, IoT-11-v4

			with the affected IoT device that had been configured on the MUD PEP router/switch.	
CR-12	The IoT DDoS example implementation shall include a <b>MUD manager that uses a cached MUD file rather than retrieve a new one if the cache-validity time period has not yet elapsed</b> for the MUD file indicated by the MUD URL. <b>The MUD manager should fetch a new MUD file if the cache-validity time period has already elapsed.</b>			IoT-10-v4
CR-12.a		The MUD manager shall check if the file associated with the <b>MUD URL is present in its cache</b> and shall determine that it is.		IoT-10-v4
CR-12.a.1			The MUD manager shall <b>check whether the amount of time that has elapsed since the cached file was retrieved is less than or equal to the number of hours in</b>	IoT-10-v4

Capability Requirement (CR)-ID	Parent Requirement	Subrequirement 1	Subrequirement 2	Test Case
			<b>the cache-validity value for this MUD file.</b> If so, the MUD manager shall apply the contents of the cached MUD file.	
CR-12.a.2			The MUD manager <b>shall check whether the amount of time that has elapsed since the cached file was retrieved is greater than the number of hours in the cache-validity value for this MUD file.</b> If so, the MUD manager may (but does not have to) fetch a new file by using the MUD URL received.	IoT-10-v4
CR-13	The IoT DDoS example implementation shall ensure that for each rule in a MUD file that pertains to an external domain, the gateway will be configured with <b>all possible instantiations of that rule</b> , insofar as <b>each instantiation contains one of the IP addresses to which the domain in that MUD file rule may be</b>			IoT-9-v4

Capability Requirement (CR)-ID	Parent Requirement	Subrequirement 1	Subrequirement 2	Test Case
	<b>resolved when queried by the gateway.</b>			
CR-13.a		The MUD file for a device shall contain a rule involving a <b>domain that can resolve to multiple IP addresses</b> when queried by the gateway. <b>Flow rules for permitting access to each of those IP addresses will be inserted into the gateway</b> for the device in question, and the device will be permitted to communicate with all of those IP addresses.		IoT-9-v4
CR-13.a.1			IPv4 addressing is used on the network.	IoT-9-v4

### 4.1.2 Test Cases

This section contains the test cases that were used to verify that Build 3 met the requirements listed in Table 4-1.

#### 4.1.2.1 Test Case IoT-1-v4

**Table 4-2: Test Case IoT-1-v4**

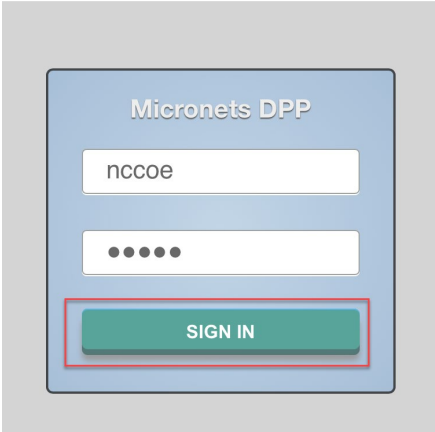

Test Case Field	Description
Parent Requirements	<p>(CR-1) The IoT DDoS example implementation shall include a mechanism for associating a device with a MUD file URL (e.g., by having the MUD-enabled IoT device emit a MUD file URL via DHCP, LLDP, or X.509 or by using some other mechanism to enable the network to associate a device with a MUD file URL).</p> <p>(CR-2) The IoT DDoS example implementation shall include the capability for the MUD URL to be provided to a MUD manager.</p> <p>(CR-3) The IoT DDoS example implementation shall include a MUD manager that can request a MUD file and signature from a MUD file server.</p> <p>(CR-4) The IoT DDoS example implementation shall include a MUD file server that can serve a MUD file and signature to the MUD manager.</p> <p>(CR-5) The IoT DDoS example implementation shall include a MUD manager that can translate local network configurations based on the MUD file.</p> <p>(CR-6) The IoT DDoS example implementation shall include a MUD manager that can configure the Micronets Gateway with ACLs that enforce the MUD file rules.</p>
Testable Requirements	<p>(CR-1.a) The device's MUD file is located by using two items in the device's bootstrapping information (which is encoded in its QR code): the information element and the public bootstrapping key.</p> <p>(CR-1.a.1) The information element identifies a device vendor, and each vendor is assumed to have a well-known location for serving MUD files, so this element identifies the location of the device's MUD file server. The public bootstrapping key of the device identifies the device's MUD file.</p> <p>(CR-2.a) The device bootstrapping information shall be sent to the DPP configurator as part of the device DPP onboarding request.</p> <p>(CR-2.a.1) The bootstrapping information (and in particular the information element and public bootstrapping key) are received at the DPP configurator.</p> <p>(CR-2.b) The DPP configurator shall use the bootstrapping information to look up the MUD URL and send it to the MUD manager.</p> <p>(CR-2.b.1) The MUD manager shall receive the MUD URL.</p> <p>(CR-3.a) The MUD manager shall use the GET method (RFC 7231) to request MUD and signature files (per RFC 7230) from the MUD file server</p>

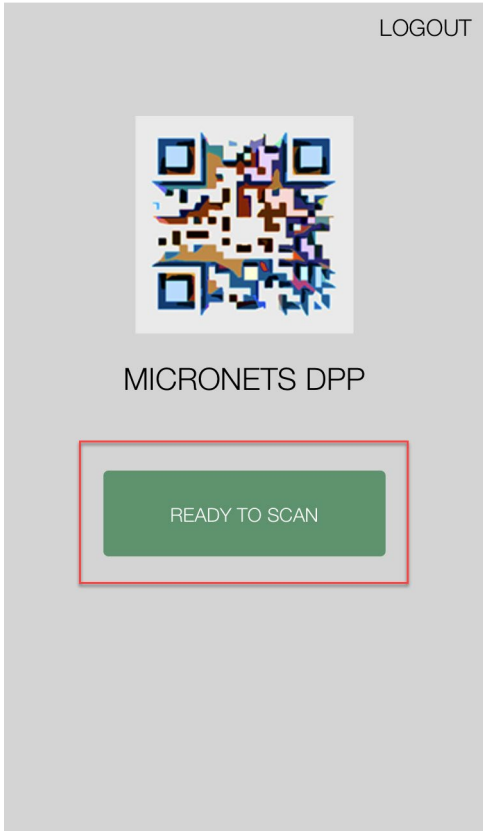

Test Case Field	Description
	<p>and can validate the MUD file server's TLS certificate by using the rules in RFC 2818.</p> <p>(CR-3.a.1) The MUD file server shall receive the https request from the MUD manager.</p> <p>(CR-4.a) The MUD file server shall serve the file and signature to the MUD manager, and the MUD manager shall check to determine whether the certificate used to sign the MUD file (signed using DER-encoded CMS [RFC 5652]) was valid at the time of signing, i.e., the certificate had not expired.</p> <p>(CR-5.a) The MUD manager shall successfully validate the signature of the MUD file.</p> <p>(CR-5.a.1) The MUD manager, after validation of the MUD file signature, shall check for an existing MUD file and translate abstractions in the MUD file to gateway configurations.</p> <p>(CR-6.a) The MUD manager shall install ACLs on the Micronets Gateway.</p> <p>(CR-6.a.1) The gateway shall have been configured to enforce the route filter sent by the MUD manager.</p>
Description	Shows that when a device that has a MUD file is onboarded to the network using DPP and that device's bootstrapping information includes an information element value to indicate the location of the device's manufacturer and a public bootstrapping key to indicate the device's MUD file, the device will have its gateway automatically configured to enforce the route filtering that is described in the device's MUD file, assuming the MUD file has a valid signature and is served from a MUD file server that has a valid TLS certificate.
Associated Test Case(s)	N/A
Associated Cybersecurity Framework Subcategory(ies)	ID.AM-1, ID.AM-2, ID.AM-3, PR.DS-5, DE.AE-1, PR.AC-4, PR.AC-5, PR.IP-1, PR.IP-3, PR.PT-3, PR.DS-2
IoT Device(s) Under Test	Raspberry Pi
MUD File(s) Used	<i>nist-model-fe_northsouth.json</i>

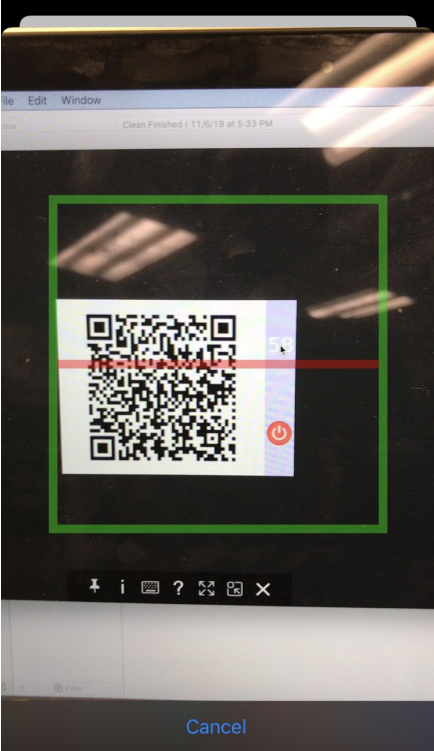

Test Case Field	Description
Preconditions	<ol style="list-style-type: none"> <li>1. All devices have been configured to use IPv4.</li> <li>2. This MUD file is not currently cached at the MUD manager.</li> <li>3. The device's MUD file has a valid signature that was signed by a certificate that had not yet expired, and it is being hosted on a MUD file server that has a valid TLS certificate.</li> <li>4. The gateway does not yet have any configuration settings pertaining to the IoT device being used in the test.</li> <li>5. The MUD file for the IoT device being used in the test is identical to the MUD file provided in Section 4.1.3.</li> <li>6. The mobile phone onboarding application is installed and logged into the subscriber account that is associated with the gateway.</li> </ol>
Procedure	<p>Verify that the gateway for the IoT device to be used in the test does not yet have any configuration settings installed with respect to the IoT device being used in the test. Also verify that the MUD file of the IoT device to be used is not currently cached at the MUD manager.</p> <ol style="list-style-type: none"> <li>1. Power on the IoT device.</li> <li>2. Put the IoT device into DPP onboarding mode by clicking the + button. This will cause it to display a QR code and begin listening for DPP messages on the frequency indicated by the QR code.</li> <li>3. Open the onboarding application on the mobile phone and click READY TO SCAN.</li> <li>4. Position the mobile phone's camera to read the device's QR code. Do this in a timely manner because there is a 60-second countdown for the device to exit DPP onboarding mode.</li> <li>5. Input additional device-specific information into the mobile onboarding application as requested (must be done within the same 60-second time limit): <ol style="list-style-type: none"> <li>a. Assign the device to its own unique micronets class (e.g., Generic) to which no other device is or will be assigned.</li> <li>b. Give the device a unique name (e.g., Device 1).</li> </ol> </li> </ol>

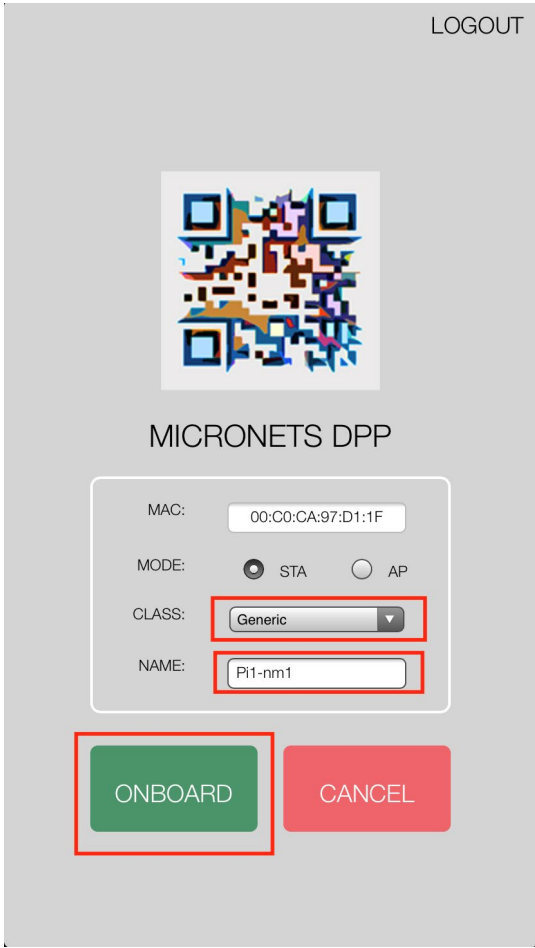

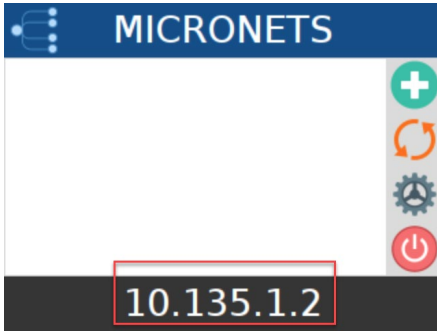

Test Case Field	Description
	<ul style="list-style-type: none"> <li>c. Click the ONBOARD button on the mobile application. This causes the onboarding application to send the device's bootstrapping information to the DPP configurator on the gateway via the operator's multiple-system operator (MSO) portal and cloud infrastructure.</li> </ul> <p>6. Wait. The following operations are being performed automatically in the operator's cloud infrastructure:</p> <ul style="list-style-type: none"> <li>a. The Micronets Manager receives the bootstrapping information.</li> <li>b. It looks up the URL of the device's MUD file.</li> <li>c. It provides the MUD file URL to the MUD manager.</li> <li>d. The MUD manager contacts the MUD file server and verifies that it has a valid TLS certificate.</li> <li>e. The MUD manager requests the MUD file and the MUD signature file and validates the MUD file.</li> <li>f. The MUD manager parses the MUD rules and translates these to ACLs (route filtering rules) that it sends to the Micronets Manager.</li> <li>g. The Micronets Manager provisions the device on the Micronets Gateway and installs MUD ACLs for the device so that the gateway is now configured to enforce the policies specified in the MUD file.</li> <li>h. The gateway briefly switches to the device's frequency and initiates DPP authentication.</li> <li>i. The device switches to the gateway's frequency and receives its network credentials via DPP.</li> <li>j. The device connects to the network.</li> </ul> <p>7. View the logs on the gateway to verify that:</p>

Test Case Field	Description
	<ul style="list-style-type: none"> <li>a. The bootstrapping information was received at the configurator.</li> <li>b. The authentication phase of DPP onboarding occurred for the device. This is a three-way handshake among the device and the gateway.</li> <li>c. The configuration phase of DPP onboarding occurred for the device (another three-way handshake).</li> </ul> <p>8. Verify that the ACLs that reflect the MUD file rules have been installed on the gateway.</p>
Expected Results	The gateway has had its configuration changed, i.e., it has been configured to enforce the policies specified in the IoT device's MUD file. ACLs are installed on the gateway to reflect MUD filtering rules.
Actual Results	<p><b><u>Onboarding:</u></b></p> <p><b><u>Step 1—sign in to application:</u></b></p>  <p><b><u>Step 2—click READY TO SCAN on mobile application:</u></b></p>

Test Case Field	Description
Overall Results	Pass

IPv6 is not supported in this implementation.

#### 4.1.2.2 Test Case IoT-2-v4

**Table 4-3: Test Case IoT-2-v4**

Test Case Field	Description
Parent Requirement	(CR-3) The IoT DDoS example implementation shall include a MUD manager that can request a MUD file and signature from a MUD file server.
Testable Requirement	<p>(CR-3.b) The MUD manager shall use the GET method (RFC 7231) to request MUD and signature files (per RFC 7230) from the MUD file server, but it cannot validate the MUD file server's TLS certificate by using the rules in RFC 2818.</p> <p>(CR-3.b.1) The MUD manager shall drop the connection to the MUD file server.</p> <p>(CR-3.b.2) The MUD manager shall send locally defined policy to the gateway that handles whether to allow or block traffic to and from the MUD-enabled IoT device.</p>
Description	Shows that if a MUD manager cannot validate the TLS certificate of a MUD file server when trying to retrieve the MUD file for a specific IoT device, the MUD manager will drop the connection to the MUD file server and configure the gateway according to locally defined policy regarding whether to allow or block traffic to the IoT device in question.
Associated Test Case(s)	IoT-11-v4
Associated Cybersecurity Framework Subcategory(ies)	PR.AC-7
IoT Device(s) Under Test	Raspberry Pi

Test Case Field	Description
MUD File(s) Used	<i>nist-model-fe_northsouth.json</i>
Preconditions	<ol style="list-style-type: none"> <li>1. All devices have been configured to use IPv4.</li> <li>2. This MUD file is not currently cached at the MUD manager.</li> <li>3. The MUD file server that is hosting the MUD file of the device under test does not have a valid TLS certificate.</li> <li>4. Local policy has been defined to ensure that if the MUD file for a device is located on a server with an invalid certificate, the gateway will be configured to provision the device and permit it unrestricted communications as if it had not been associated with a MUD file.</li> <li>5. The gateway for the IoT device to be used in the test does not yet have any configuration settings with respect to the IoT device being used in the test.</li> <li>6. The mobile phone onboarding application is installed and logged into the subscriber account that is associated with the gateway.</li> </ol>
Procedure	<p>Verify that the gateway for the IoT device to be used in the test does not yet have any configuration settings installed with respect to the IoT device being used in the test. Also verify that the MUD file of the IoT device to be used is not currently cached at the MUD manager.</p> <ol style="list-style-type: none"> <li>1. Power on the IoT device.</li> <li>2. Put the IoT device into DPP onboarding mode by clicking the + button. This will cause it to display a QR code and begin listening for DPP messages.</li> <li>3. Open the onboarding application on the mobile phone and click READY TO SCAN.</li> <li>4. Position the mobile phone's camera to read the device's QR code. Do this in a timely manner because there is a 60-second countdown for the device to exit DPP onboarding mode.</li> </ol>

Test Case Field	Description
	<ol style="list-style-type: none"> <li>5. Input additional device-specific information into the mobile onboarding application as requested (must be done within the same 60-second time limit):               <ol style="list-style-type: none"> <li>a. Assign the device to its own unique micronets class (e.g., Security) to which no other device is or will be assigned.</li> <li>b. Give the device a unique name (e.g., Device 1).</li> <li>c. Click the ONBOARD button on the mobile application. This causes the onboarding application to send the device's bootstrapping information to the DPP configurator on the gateway via the operator's MSO portal and cloud infrastructure.</li> </ol> </li> <li>6. Wait. The following operations are being performed automatically in the operator's cloud infrastructure:               <ol style="list-style-type: none"> <li>a. The Micronet's Manager receives the bootstrapping information.</li> <li>b. It looks up the URL of the device's MUD file.</li> <li>c. It provides the MUD file URL to the MUD manager.</li> <li>d. The MUD manager contacts the MUD file server, determines that it does not have a valid TLS certificate, and drops the connection to the MUD file server.</li> <li>e. The Micronets Manager provisions the device on the gateway as if the device had not been associated with a MUD file. In other words, the device does not have any MUD-related restrictions imposed on its communications. (Note that it is a local policy decision as to whether the implementation will fail "closed" and restrict all communications or fail "open" [as this implementation does] and not impose any communications restrictions. In theory, the implementation could assign the device to a more restricted micronet.)</li> </ol> </li> </ol>

Test Case Field	Description
Expected Results	The gateway has had its configuration changed, i.e., it has been configured to permit the device to connect to the network and communicate without any MUD-based restrictions.
Actual Results	<pre> 2020-02-20 14:54:42,699 micronets-mud-manager: INFO get- MudInfo called with: {'url': 'https://nccoe-mud-server.mi- cronets.in/micronets-mud/nist-model-fe_samemanufacturer- to.json'} 2020-02-20 14:54:42,700 micronets-mud-manager: INFO getMUD- File: url: https://nccoe-mud-server.micronets.in/micronets- mud/nist-model-fe_samemanufacturer-to.json 2020-02-20 14:54:42,703 micronets-mud-manager: INFO getMUD- File: mud filepath for https://nccoe-mud-server.mi- cronets.in/micronets-mud/nist-model-fe_samemanufacturer- to.json: /mud-cache-dir/nccoe-mud-server.micronets.in_mi- cronets-mud_nist-model-fe_samemanufacturer-to.json... 2020-02-20 14:54:42,705 micronets-mud-manager: INFO getMUD- File: RETRIEVING https://nccoe-mud-server.micronets.in/mi- cronets-mud/nist-model-fe_samemanufacturer-to.json [2020-02-20 14:54:42,760] ERROR in app: Exception on request POST /getMudInfo ssl.SSLError: [SSL: CERTIFICATE_VERIFY_FAILED] certificate verify failed (_ssl.c:852) </pre>
Overall Results	Pass

IPv6 is not supported in this implementation.

#### 4.1.2.3 Test Case IoT-3-v4

**Table 4-4: Test Case IoT-3-v4**

Test Case Field	Description
Parent Requirement	(CR-4) The IoT DDoS example implementation shall include a MUD file server that can serve a MUD file and signature to the MUD manager.
Testable Requirement	(CR-4.b) The MUD file server shall serve the file and signature to the MUD manager, and the MUD manager shall check to determine whether the certificate used to sign the MUD file was valid at the time of signing.

Test Case Field	Description
	<p>It shall determine that the certificate had already expired when it was used to sign the MUD file.</p> <p>(CR-4.b.1) The MUD manager shall cease to process the MUD file.</p> <p>(CR-4.b.2) The MUD manager shall send locally defined policy to the gateway that handles whether to allow or block traffic to and from the MUD-enabled IoT device.</p>
Description	Shows that if a MUD file server serves a MUD file with a signature that was created with an expired certificate, the MUD manager will cease processing the MUD file.
Associated Test Case(s)	IoT-11-v4
Associated Cybersecurity Framework Subcategory(ies)	PR.DS-6
IoT Device(s) Under Test	Raspberry Pi
MUD File(s) Used	<i>nist-model-fe_expiredcert.json</i>
Preconditions	<ol style="list-style-type: none"> <li>1. All devices have been configured to use IPv4.</li> <li>2. This MUD file is not currently cached at the MUD manager.</li> <li>3. The IoT device's MUD file is being hosted on a MUD file server that has a valid TLS certificate, but the MUD file signature was signed by a certificate that had already expired at the time of signature.</li> <li>4. Local policy has been defined to ensure that if the MUD file for a device has a signature that was signed by a certificate that had already expired at the time of signature, the gateway will provision the device and permit it unrestricted communications as if it had not been associated with a MUD file.</li> <li>5. The gateway does not yet have any configuration settings with respect to the IoT device being used in the test.</li> </ol>

Test Case Field	Description
	<p>6. The mobile phone onboarding application is installed and logged into the subscriber account that is associated with the gateway.</p>
Procedure	<p>Verify that the gateway does not yet have any configuration settings installed with respect to the IoT device being used in the test.</p> <p>Verify that the gateway for the IoT device to be used in the test does not yet have any configuration settings installed with respect to the IoT device being used in the test. Also verify that the MUD file of the IoT device to be used is not currently cached at the MUD manager.</p> <ol style="list-style-type: none"> <li>1. Power on the IoT device.</li> <li>2. Put the IoT device into DPP onboarding mode by clicking the + button. This will cause it to display a QR code and begin listening for DPP messages.</li> <li>3. Open the onboarding application on the mobile phone and click READY TO SCAN.</li> <li>4. Position the mobile phone's camera to read the device's QR code. Do this in a timely manner because there is a 60-second countdown for the device to exit DPP onboarding mode.</li> </ol>

Test Case Field	Description
	<ol style="list-style-type: none"> <li>5. Input additional device-specific information into the mobile onboarding application as requested (must be done within the same 60-second time limit):               <ol style="list-style-type: none"> <li>a. Assign the device to its own unique micronets class (e.g., Shared) to which no other device is or will be assigned.</li> <li>b. Give the device a unique name (e.g., Device 1).</li> <li>c. Click the ONBOARD button on the mobile application. This causes the onboarding application to send the device's bootstrapping information to the DPP configurator on the gateway via the operator's MSO portal and cloud infrastructure.</li> </ol> </li> <li>6. Wait. The following operations are being performed automatically in the operator's cloud infrastructure:               <ol style="list-style-type: none"> <li>a. The Micronets Manager receives the bootstrapping information.</li> <li>b. It looks up the URL of the device's MUD file.</li> <li>c. It provides the MUD file URL to the MUD manager.</li> <li>d. The MUD manager contacts the MUD file server, verifies that it has a valid TLS certificate, and requests the MUD file and signature from the MUD file server.</li> <li>e. The MUD file server serves the MUD file and signature to the MUD manager, and the MUD manager detects that the MUD file's signature was created by using a certificate that had already expired at the time of signing.</li> <li>f. The Micronets Manager provisions the device on the gateway as if the device had not been associated with a MUD file. In other words, the device does not have any MUD-related restrictions imposed on its communications. (Note that it is a local policy decision as to</li> </ol> </li> </ol>

Test Case Field	Description
	<p>whether the implementation will fail “closed” and restrict all communications or fail “open” [as this implementation does] and not impose any communications restrictions. In theory, the implementation could assign the device to a more restricted micronet.)</p>
Expected Results	<p>The gateway has had its configuration changed, i.e., it has been configured to permit the device to connect to the network and communicate without any MUD-based restrictions.</p>

#### 4.1.2.4 Test Case IoT-4-v4

**Table 4-5: Test Case IoT-4-v4**

Test Case Field	Description
Parent Requirement	(CR-5) The IoT DDoS example implementation shall include a MUD manager that can translate local network configurations based on the MUD file.
Testable Requirement	<p>(CR-5.b) The MUD manager shall attempt to validate the signature of the MUD file, but the signature validation fails (even though the certificate that had been used to create the signature had not been expired at the time of signing, i.e., the signature is invalid for a different reason).</p> <p>(CR-5.b.1) The MUD manager shall cease processing the MUD file.</p> <p>(CR-5.b.2) The MUD manager shall send locally defined policy to the gateway that handles whether to allow or block traffic to and from the MUD-enabled IoT device.</p>
Description	Shows that if the MUD manager determines that the signature on the MUD file it receives from the MUD file server is invalid, it will cease processing the MUD file and configure the gateway according to locally defined policy regarding whether to allow or block traffic to the IoT device in question.
Associated Test Case(s)	IoT-11-v4

#### 4.1.2.5 Test Case IoT-5-v4

**Table 4-6: Test Case IoT-5-v4**

Test Case Field	Description
Parent Requirement	<p>(CR-7) The IoT DDoS example implementation shall allow the MUD-enabled IoT device to communicate with approved internet services in the MUD file.</p> <p>(CR-8) The IoT DDoS example implementation shall deny communications from a MUD-enabled IoT device to unapproved internet services</p>

Test Case Field	Description
	(i.e., services that are implicitly denied by virtue of not being explicitly approved).
Testable Requirement	<p>(CR-7.a) The MUD-enabled IoT device shall attempt to initiate outbound traffic to approved internet services.</p> <p>(CR-7.a.1) The gateway shall receive the attempt and shall allow it to pass based on the filters from the MUD file.</p> <p>(CR-7.b) An approved internet service shall attempt to initiate a connection to the MUD-enabled IoT device.</p> <p>(CR-7.b.1) The gateway shall receive the attempt and shall allow it to pass based on the filters from the MUD file.</p> <p>(CR-8.a) The MUD-enabled IoT device shall attempt to initiate outbound traffic to unapproved (implicitly denied) internet services.</p> <p>(CR-8.a.1) The gateway shall receive the attempt and shall deny it based on the filters from the MUD file.</p> <p>(CR-8.b) An unapproved (implicitly denied) internet service shall attempt to initiate a connection to the MUD-enabled IoT device.</p> <p>(CR-8.b.1) The gateway shall receive the attempt and shall deny it based on the filters from the MUD file.</p> <p>(CR-8.c) The MUD-enabled IoT device shall initiate communications to an internet service that is approved to initiate communications with the MUD-enabled device but not approved to receive communications initiated by the MUD-enabled device.</p> <p>(CR-8.c.1) The gateway shall receive the attempt and shall deny it based on the filters from the MUD file.</p> <p>(CR-8.d) An internet service shall initiate communications to a MUD-enabled device that is approved to initiate communications with the internet service but that is not approved to receive communications initiated by the internet service.</p> <p>(CR-8.d.1) The gateway shall receive the attempt and shall deny it based on the filters from the MUD file.</p>
Description	Shows that, upon connection to the network, a MUD-enabled IoT device used in the IoT DDoS example implementation has a gateway that is configured to enforce the route filtering that is described in the device's MUD file with respect to communication with internet services. Further,

Test Case Field	Description
	it shows that the policies that are configured on the gateway with respect to communication with internet services will be enforced as expected, with communications that are configured as denied being blocked and communications that are configured as permitted being allowed.
Associated Test Case(s)	IoT-1-v4
Associated Cybersecurity Framework Subcategory(ies)	ID.AM-3, PR.DS-5, PR.IP-1, PR.PT-3
IoT Device(s) Under Test	Raspberry Pi
MUD File(s) Used	<i>nist-model-fe_northsouth.json</i>
Preconditions	<p>Test IoT-1-v4 has run successfully, meaning that the gateway has been configured to enforce the following policies for the IoT device in question (as defined in the MUD file in Section 4.1.3):</p> <p>Note: Preconditions with strike-through are not applicable due to NAT.</p> <ul style="list-style-type: none"> <li>a) <del>Explicitly permit <i>https://yes-permit-from.com</i> to initiate communications with the IoT device.</del></li> <li>b) Explicitly permit the IoT device to initiate communications with <i>https://yes-permit-to.com</i>.</li> <li>c) Implicitly deny all other communications with the internet, including denying: <ul style="list-style-type: none"> <li>i. <del>the IoT device to initiate communications with <i>https://yes-permit-from.com</i></del></li> <li>ii. <i>https://yes-permit-to.com</i> to initiate communications with the IoT device</li> <li>iii. communication between the IoT device and all other internet locations, such as <i>https://unnamed-to.com</i> (by not mentioning this or any other URLs in the MUD file)</li> </ul> </li> </ul>
Procedure	<p>Note: Procedure steps with strike-through were not tested due to NAT.</p> <p>As stipulated in the preconditions, just before this test, test IoT-1-v4 must have been run successfully.</p>

Test Case Field	Description
	<ol style="list-style-type: none"> <li>1. Overall Results	Pass

IPv6 is not supported in this implementation.

#### 4.1.2.6 Test Case IoT-6-v4

**Table 4-7: Test Case IoT-6-v4**

Test Case Field	Description
Parent Requirement	<p>(CR-9) The IoT DDoS example implementation shall allow the MUD-enabled IoT device to communicate laterally with devices that are approved in the MUD file.</p> <p>(CR-10) The IoT DDoS example implementation shall deny lateral communications from a MUD-enabled IoT device to devices that are not approved in the MUD file (i.e., devices that are implicitly denied by virtue of not being explicitly approved).</p>
Testable Requirement	<p>(CR-9.a) The MUD-enabled IoT device shall attempt to initiate lateral traffic to approved devices.</p> <p>(CR-9.a.1) The gateway shall receive the attempt and shall allow it to pass based on the filters from the MUD file.</p> <p>(CR-9.b) An approved device shall attempt to initiate a lateral connection to the MUD-enabled IoT device.</p> <p>(CR-9.b.1) The gateway shall receive the attempt and shall allow it to pass based on the filters from the MUD file.</p> <p>(CR-10.a) The MUD-enabled IoT device shall attempt to initiate lateral traffic to unapproved (implicitly denied) devices.</p> <p>(CR-10.a.1) The gateway shall receive the attempt and shall deny it based on the filters from the MUD file.</p> <p>(CR-10.b) An unapproved (implicitly denied) device shall attempt to initiate a lateral connection to the MUD-enabled IoT device.</p> <p>(CR-10.b.1) The gateway shall receive the attempt and shall deny it based on the filters from the MUD file.</p>
Description	<p>Shows that, upon connection to the network, a MUD-enabled IoT device used in the IoT DDoS example implementation has its gateway automatically configured to enforce the route filtering that is described in the device's MUD file with respect to communication with lateral devices. Further, it shows that the policies that are configured on the gateway with respect to communication with lateral devices will be enforced as expected, with communications that are configured as denied being blocked and communications that are configured as permitted being allowed.</p>
Associated Test Case(s)	IoT-1-v4

Test Case Field	Description
Associated Cybersecurity Framework Subcategory(ies)	ID.AM-3, PR.DS-5, PR.AC-5, PR.IP-1, PR.PT-3, PR.IP-3, PR.DS-3
IoT Device(s) Under Test	Raspberry Pi
MUD File(s) Used	<i>nist-model-fe_controller_anyport.json, nist-model-fe_localnetwork_anyport.json, nist-model-fe_manufacturer1.json, nist-model-fe_manufacturer2.json, nist-model-fe_manufacturer-from.json, nist-model-fe_manufacturer-to.json, nist-model-fe_mycontroller.json, nist-model-fe_samemanager.json, nist-model-fe_samemanager-from.json, nist-model-fe_samemanager-to.json</i>
Preconditions	<p>a) Test IoT-1-v4 has run successfully numerous times to onboard local devices (<i>anyhost-to</i>, <i>anyhost-from</i>, <i>unnamed-host</i>, a device of a specific manufacturer class, and a device of the same manufacturer class) needed to test enforcement of local communications. These devices have all been onboarded to separate micronets. As a result, the gateway has been configured to enforce the following policies for each IoT device in question with respect to local communications (as defined in the MUD files in Section 4.1.3). (Please note that the cases below that have strike-throughs are untestable for the following reasons. First, Micronets does not yet support port-level flow rules. Second, NAT prevents certain communication attempts, making particular test cases untestable. Third, for devices to be considered on the local network, they must be on the same micronet. Communication within the same micronet will always be allowed and cannot be constrained by MUD rules.</p> <p>b) <del>Local network class—Explicitly permit local communication to and from the IoT device and any local hosts (including the specific local hosts <i>anyhost-to</i> and <i>anyhost-from</i>) for specific services, as specified in the MUD file by source port: any; destination port: 80; and protocol: TCP, and which party initiates the connection.</del></p> <p>c) Manufacturer class—Explicitly permit <b>local communication to and from the IoT device and other classes of IoT devices, as</b></p>

Test Case Field	Description
	<p><del>identified by their MUD URL (<i>www.devicetype.com</i>), and further constrained by source port: any; destination port: 80; and protocol: TCP.</del></p> <p>d) Same-manufacturer class—Explicitly permit <b>local communication to and from IoT devices of the same manufacturer as the IoT device in question (the domain in the MUD URLs [mudfileservers] of the other IoT devices is the same as the domain in the MUD URL [mudfileservers] of the IoT device in question),</b> <del>and further constrained by source port: any; destination port: 80; and protocol: TCP.</del></p> <p>e) Implicitly deny all other local communication that is not explicitly permitted in the MUD file, including denying</p> <ul style="list-style-type: none"> <li>i. <b><i>anyhost-to</i> to initiate communications</b> with the IoT device</li> <li>ii. <del>the IoT device to initiate communications with <i>anyhost-to</i> by using a source port, destination port, or protocol (TCP or UDP) that is not explicitly permitted</del></li> <li>iii. <b>the IoT device to initiate communications with <i>any-host-from</i></b></li> <li>iv. <del><b><i>anyhost from</i> to initiate communications</b> with the IoT device by using a source port, destination port, or protocol (TCP or UDP) that is not explicitly permitted</del></li> <li>v. communications between the IoT device and all lateral hosts (including <i>unnamed-host</i>) whose <b>MUD URLs are not explicitly mentioned</b> as being permissible in the MUD file</li> <li>vi. <del>communications between the IoT device and all lateral hosts whose <b>MUD URLs are explicitly mentioned</b> as being permissible <b>but using a source port, destination port, or protocol (TCP or UDP) that is not explicitly permitted</b></del></li> <li>vii. communications between the IoT device and all lateral hosts that are <b>not from the same manufacturer</b> as the IoT device in question</li> <li>viii. <del>communications between the IoT device and a lateral host that <b>is from the same manufacturer but using a</b></del></li> </ul>

Test Case Field	Description
	<del>source port, destination port, or protocol (TCP or UDP) that is not explicitly permitted</del>
Procedure	<p>Note: Procedure steps with strike-through were not tested in this phase because ingress DACLs are not supported in this implementation.</p> <p>As stipulated in the preconditions, just before this test, test IoT-1-v4 must have been run successfully to onboard the other local devices. <u>Note that when each device is onboarded, the user performing the onboarding must assign each device to its own separate micronet.</u></p> <p>Local-network (ingress): Initiate communications to the IoT device from <i>anyhost-from</i> <b>for specific permitted service</b>, and verify that this traffic is received at the IoT device.</p> <ol style="list-style-type: none"> <li>1. Local-network (egress): <del>Initiate communications from the IoT device to anyhost-from</del> for specific permitted service, and verify that this traffic is received at the gateway, but it <b>is not forwarded</b> by the gateway, nor is it received at <i>anyhost-from</i>.</li> <li>2. Local-network, controller, my-controller, manufacturer class (egress): Initiate communications from the IoT device to <i>anyhost-to</i> <b>for specific permitted service</b>, and verify that this traffic <b>is received</b> at <i>anyhost-to</i>.</li> <li>3. <del>Local-network</del>, controller, my-controller, manufacturer class (ingress): <b>Initiate communications to the IoT device from anyhost-to</b> for specific permitted service, and verify that this traffic is received at the gateway, but it <b>is not forwarded</b> by the gateway, nor is it received at the IoT device.</li> <li>4. No associated class (egress): Initiate communications from the IoT device to <i>unnamed-host</i> (where <i>unnamed-host</i> is a host that is not from the same manufacturer as the IoT device in question and whose <b>MUD URL is not explicitly mentioned in the MUD file as being permitted</b>), and verify that this traffic is received at the gateway, but it <b>is not forwarded</b> by the gateway, nor is it received at <i>unnamed-host</i>. (Reminder: For this to work, each device must have been manually assigned to its own separate micronet during the onboarding process.)</li> <li>5. No associated class (ingress): Initiate communications to the IoT device from <i>unnamed-host</i> (where <i>unnamed-host</i> is a host that is not from the same manufacturer as the IoT device in question and</li> </ol>

Test Case Field	Description
	<p>whose <b>MUD URL is not explicitly mentioned in the MUD file as being permitted</b>), and verify that this traffic is received at the gateway, but it is not forwarded by the gateway, nor is it received at the IoT device.</p> <p>6. Same-manufacturer class (egress): Initiate communications from the IoT device to <i>same-manufacturer-host</i> (where <i>same-manufacturer-host</i> is a <b>host that is from the same manufacturer as the IoT device</b> in question), and verify that this traffic <b>is received</b> at <i>same-manufacturer-host</i>.</p> <p>7. Same-manufacturer class (egress): Initiate communications from the IoT device to <i>same-manufacturer-host</i> (where <i>same-manufacturer-host</i> is a <b>host that is from the same manufacturer as the IoT device</b> in question) <b>but using a port or protocol that is not specified</b>, and verify that this traffic is received at the gateway, but it <b>is not forwarded</b> by the gateway, nor is it received at <i>same-manufacturer-host</i>.</p>
Expected Results	Each of the results that is listed as needing to be verified in the procedure steps above occurs as expected.
Actual Results	<p>The numbering in this section correlates with the procedure steps above:</p> <p>2. Overall Results	<p>Partial Pass. The gateway was configured to enforce all route filtering that is described in the device's MUD file with respect to communication with lateral devices, with the exception of MUD rules that pertain to specific ports. At the time of this functional demonstration, Micronets did not yet support port-level flow rules. Therefore, the implementation we tested was not able to enforce any port-specific route filtering that is described in the device's MUD file with respect to communication with lateral devices. If a MUD file rule permitted the device to communicate with a lateral host using only a specific port or ports, the Micronets implementation was observed to incorrectly permit the device to communicate to all ports of that permitted host, even though that communication should have been restricted to using only the specific port or ports specified in the MUD file.</p>

IPv6 is not supported in this implementation.

#### 4.1.2.7 Test Case IoT-9-v4

**Table 4-8: Test Case IoT-9-v4**

Test Case Field	Description
Parent Requirements	(CR-13) The IoT DDoS example implementation shall ensure that for each rule in a MUD file that pertains to an external domain, the gateway will be configured with all possible instantiations of that rule, insofar as each instantiation contains one of the IP addresses to which the domain in that MUD file rule may be resolved when queried by the gateway.
Testable Requirements	<p>(CR-13.a) The MUD file for a device shall contain a rule involving a domain that can resolve to multiple IP addresses when queried by the gateway.</p> <p>Flow rules for permitting access to each of those IP addresses will be inserted into the gateway for the device in question, and the device will be permitted to communicate with all of those IP addresses.</p>
Description	<p>Shows that if a domain in a MUD file rule resolves to multiple IP addresses when the address resolution is requested by the gateway, then</p> <ol style="list-style-type: none"> <li>1. ACLs instantiating that MUD file rule corresponding to each of these IP addresses will be configured in the gateway for the IoT device associated with the MUD file, and</li> <li>2. The IoT device associated with the MUD file will be permitted to communicate with all the IP addresses to which that domain resolves</li> </ol>
Associated Test Case(s)	N/A
Associated Cybersecurity Framework Subcategory(ies)	ID.AM-1, ID.AM-2, ID.AM-3, PR.DS-5, DE.AE-1, PR.AC-4, PR.AC-5, PR.IP-1, PR.IP-3, PR.DS-2
IoT Device(s) Under Test	Raspberry Pi
MUD File(s) Used	<i>nist-model-fe_northsouth.json</i>

Test Case Field	Description
Preconditions	<ol style="list-style-type: none"> <li>1. The gateway does not yet have any flow rules pertaining to the IoT device being used in the test.</li> <li>2. The MUD file for the IoT device being used in the test is identical to the MUD file provided in Section 4.1.3. (Therefore, the MUD file used in the test permits the device to send data to <i>www.updateserver.com</i>.)</li> <li>3. The DNS server that the gateway uses resolves the domain <i>www.updateserver.com</i> to only one IP address.</li> <li>4. The tester has access to a DNS server that will be used by the gateway and can configure it so that it will resolve the domain <i>www.updateserver.com</i> to any of these addresses when queried by gateway: <i>x1.x1.x1.x1</i>, <i>y1.y1.y1.y1</i>, and <i>z1.z1.z1.z1</i>.</li> <li>5. A server is running at each of these three IP addresses.</li> </ol>
Procedure	<ol style="list-style-type: none"> <li>1. Verify that the gateway does not yet have any flow rules installed with respect to the IoT device being used in the test.</li> <li>2. Run test IoT-1-v4. The result should be that the gateway has been configured to explicitly permit the IoT device to initiate communication with <i>www.updateserver.com</i>.</li> <li>3. Attempt to reach <i>www.updateserver.com</i> on the device, and see that the gateway is then configured with ACLs that permit the IoT device to send data to IP addresses <i>x1.x1.x1.x1</i>, <i>y1.y1.y1.y1</i>, and <i>z1.z1.z1.z1</i>.</li> <li>4. Have the device in question attempt to connect to <i>x1.x1.x1.x1</i>, <i>y1.y1.y1.y1</i>, and <i>z1.z1.z1.z1</i>.</li> </ol>
Expected Results	<p>The gateway has had its configuration changed, i.e., it has been configured with ACLs that permit the IoT device to send data to multiple IP addresses (i.e., <i>x1.x1.x1.x1</i>, <i>y1.y1.y1.y1</i>, and <i>z1.z1.z1.z1</i>).</p> <p>The IoT device is permitted to send data to each of the servers at these addresses.</p>

Overall Result	Pass

IPv6 is not supported in this implementation.

#### 4.1.2.8 Test Case IoT-10-v4

**Table 4-9: Test Case IoT-10-v4**

Test Case Field	Description
Parent Requirements	(CR-12) The IoT DDoS example implementation shall include a MUD manager that uses a cached MUD file rather than retrieve a new one if the cache-validity time period has not yet elapsed for the MUD file indicated by the MUD URL. The MUD manager should fetch a new MUD file if the cache-validity time period has already elapsed.
Testable Requirements	<p>(CR-12.a) The MUD manager shall check if the file associated with the MUD URL is present in its cache and shall determine that it is.</p> <p>(CR-12.a.1) The MUD manager shall check whether the amount of time that has elapsed since the cached file was retrieved is less than or equal to the number of hours in the cache-validity value for this MUD file. If so, the MUD manager shall apply the contents of the cached MUD file.</p> <p>(CR-12.a.2) The MUD manager shall check whether the amount of time that has elapsed since the cached file was retrieved is greater than the number of hours in the cache-validity value for this MUD file. If so, the MUD manager may (but does not have to) fetch a new file by using the MUD URL received.</p>

Test Case Field	Description
Description	Shows that, upon connection of a MUD-enabled IoT device, the gateway has already been configured to enforce the route filtering that is described in the cached MUD file for that device's MUD URL, assuming that the amount of time that has elapsed since the cached MUD file was retrieved is less than or equal to the number of hours in the file's cache-validity value. If the cache validity has expired for the respective file, the MUD manager should fetch a new MUD file from the MUD file server.
Associated Test Case(s)	N/A
Associated Cybersecurity Framework Subcategory(ies)	ID.AM-1, ID.AM-2, ID.AM-3, PR.DS-5, DE.AE-1, PR.AC-4, PR.AC-5, PR.IP-1, PR.IP-3, PR.DS-2, PR.PT-3
IoT Device(s) Under Test	Raspberry Pi
MUD File(s) Used	<i>nist-model-fe_mycontroller.json</i>
Preconditions	<ol style="list-style-type: none"> <li>1. All devices have been configured to use IPv4.</li> <li>2. The gateway does not yet have any configuration settings pertaining to the IoT device being used in the test.</li> <li>3. The MUD file for the IoT device being used in the test is identical to the MUD file provided in Section 4.1.3.</li> </ol>
Procedure	<p>Verify that the gateway does not yet have any configuration settings installed with respect to the IoT device being used in the test.</p> <ol style="list-style-type: none"> <li>1. Run test IoT-1-v4.</li> <li>2. Within 24 hours (i.e., within the cache-validity period for the MUD file) of running test IoT-1-v4, <ol style="list-style-type: none"> <li>a. Verify that the IoT device that was connected during test IoT-1-v4 is still up and running on the network.</li> <li>b. Power on a second IoT device whose bootstrapping information indicates that it will use the same MUD file as the device that was connected during test IoT-1-v4.</li> </ol> </li> </ol>

Test Case Field	Description
	<ol style="list-style-type: none"> <li>3. Power on the IoT device.</li> <li>4. Put the IoT device into DPP onboarding mode by clicking the + button. This will cause it to display a QR code and begin listening for DPP messages.</li> <li>5. Open the onboarding application on the mobile phone and click READY TO SCAN.</li> <li>6. Position the mobile phone's camera to read the device's QR code. Do this in a timely manner because there is a 60-second countdown for the device to exit DPP onboarding mode.</li> <li>7. Input additional device-specific information into the mobile onboarding application as requested (must be done within the same 60-second time limit):             <ol style="list-style-type: none"> <li>a. Assign the device to its own unique micronets class (e.g., Medical) to which no other device is or will be assigned.</li> <li>b. Give the device a unique name (e.g., Device 1).</li> </ol> </li> <li>8. Click the ONBOARD button on the mobile application. This causes the onboarding application to send the device's bootstrapping information to the DPP configurator on the gateway via the operator's MSO portal and cloud infrastructure.</li> <li>9. Wait. The following operations are being performed automatically in the operator's cloud infrastructure:             <ol style="list-style-type: none"> <li>a. The Micronets Manager receives the bootstrapping information.</li> <li>b. It looks up the URL of the device's MUD file.</li> <li>c. It provides the MUD file URL to the MUD manager.</li> <li>d. The MUD manager determines that it has this MUD file cached and checks that the amount of time that has elapsed since the cached file was retrieved is less than or equal to the number of hours in the cache-validity value for this MUD file.                 <ol style="list-style-type: none"> <li>i. If the cache validity has been exceeded, the MUD manager will fetch a new MUD file.</li> <li>ii. Otherwise the MUD manager will use the cached MUD file.</li> </ol> </li> </ol> </li> </ol>

Test Case Field	Description
	<p>e. The MUD manager translates the MUD file's contents into appropriate route filtering rules and installs these rules as ACLs onto the gateway for the IoT device in question so that this gateway is now configured to enforce the policies specified in the MUD file.</p>
Expected Results	<p>The gateway has had its configuration changed, i.e., it has been configured to enforce the policies specified in the IoT device's MUD file. The expected configuration should resemble the following details:</p> <p><b>Cache is valid</b> (the MUD manager does NOT retrieve the MUD file from the MUD file server):</p> <p>Observing the MUD file server logs, notice that only one https Get method request for a MUD file goes out to the MUD file server. Within the next 24 hours, any additional devices onboarded using the same MUD file will not result in the MUD manager sending an https Get method request to the MUD file server to fetch a new MUD file.</p> <p><b>Cache is not valid</b> (the MUD manager does retrieve the MUD file from the MUD file server):</p> <p>Observing the MUD file server logs, notice that the MUD manager fetches a new copy of the MUD file and signature when the cache does not contain the MUD file of interest.</p>
Actual Results	<p><b><u>IoT device initial onboarding event (no cache):</u></b></p> <pre> 2020-06-11T19:37:17.244916385Z 2020-06-11 19:37:17,240 quart.serving: INFO 172.17.0.1:36502 POST /getFlowRules 1.0 200 322 8936 2020-06-11T19:45:43.446237642Z 2020-06-11 19:45:43,445 mi- cronets-mud-manager: INFO getMudInfo called with: {'url': 'https://nccoe-server2.micronets.net/micronets-mud/nist- model-fe_mycontroller.json'} 2020-06-11T19:45:43.446488467Z 2020-06-11 19:45:43,446 mi- cronets-mud-manager: INFO getMUDFile: url: https://nccoe- server2.micronets.net/micronets-mud/nist-model-fe_mycontrol- ler.json </pre>

Overall Results	Pass

IPv6 is not supported in this implementation.

#### 4.1.2.9 Test Case IoT-11-v4

**Table 4-10: Test Case IoT-11-v4**

Test Case Field	Description
Parent Requirements	(CR-1) The IoT DDoS example implementation shall include a mechanism for associating a device with a MUD file (e.g., by having the MUD-enabled IoT device emit a MUD file URL via DHCP, LLDP, or X.509 or by using some other mechanism to enable the network to associate a device with a MUD file).
Testable Requirements	(CR-1.a) The device's MUD file is located by using two items in the device's bootstrapping information (which is encoded in its QR code): the information element and the public bootstrapping key. (CR-1.a.1) The information element identifies a device vendor, and each vendor is assumed to have a well-known location for serving MUD files, so this element identifies the location of the device's MUD file server. The public bootstrapping key of the device identifies the device's MUD file.
Description	Shows that the IoT DDoS example implementation includes IoT devices that are associated with MUD files based on two of the fields in their bootstrapping information (information element and public key), which are encoded in their QR codes. (Note that in future releases, the URL for the MUD file is expected to be provided explicitly, as specified in the latest Wi-Fi Easy Connect protocol specification, so in the future there will

Test Case Field	Description
	be no need to look up the MUD file URL based on other bootstrapping fields.)
Associated Test Case(s)	N/A
Associated Cybersecurity Framework Subcategory(ies)	ID.AM-1
IoT Device(s) Under Test	Raspberry Pi 1
MUD File(s) Used	<i>nist-model-fe_mycontroller.json, nist-model-fe_manufacturer2.json</i>
Preconditions	<ol style="list-style-type: none"> <li>1. One device (Device 1) to be used has a QR code with values for its information element and public key fields that indicate the device's MUD file is <i>nist-model-fe_mycontroller.json</i> and it is located on the server hosted by the manufacturer indicated by the code in the information element field.</li> <li>2. Two other devices (Device 2 and Device 3) to be used each have QR codes with values for their information element and public key fields that indicate the device's MUD file is <i>nist-model-fe_manufacturer2.json</i> and it is located on the server hosted by the manufacturer indicated by the code in the information element field.</li> <li>3. The appropriate curl command was run to associate the public key of Device 1 with the MUD file (<i>nist-model-fe_mycontroller.json</i>).</li> <li>4. The appropriate curl command was run to associate the public keys of Device 2 and Device 3 (which are different from each other) with the same MUD file (<i>nist-model-fe_manufacturer2.json</i>).</li> <li>5. The testers have a QR code decoder, i.e., something like <a href="https://zxing.org/w/decode.jspx">https://zxing.org/w/decode.jspx</a>.</li> </ol>
Procedure	<ol style="list-style-type: none"> <li>1. Do for each of the three devices: <ol style="list-style-type: none"> <li>a. Power on the IoT device.</li> </ol> </li> </ol>

Test Case Field	Description
	<ul style="list-style-type: none"> <li> <ul style="list-style-type: none"> <li>b. Put the IoT device into DPP onboarding mode by clicking the + button. This will cause it to display a QR code and begin listening for DPP messages.</li> <li>c. Use the QR code decoder to determine the value in the QR code information element and public key fields.</li> </ul> </li> <li>2. If the three devices are supposed to all be from the same manufacturer, verify that they have equivalent information element field values; if one of the devices is supposed to be from a manufacturer different from the other two, verify that its information element field value is different.</li> <li>3. Verify that all three devices have different public keys.</li> <li>4. At this point, we have verified that the information in the QR codes is specific to the devices.</li> <li>5. We also know whether the two MUD files are expected to be on the same server (i.e., if their information element fields are identical) or on different servers (i.e., their information element fields are different).</li> <li>6. Next, verify that these different QR code values cause the devices to be associated with different MUD files.</li> <li>7. Verify that the MUD files of the IoT devices to be used are not currently cached at the MUD manager.</li> <li>8. Run test IoT-1-v4 using Device 1 (the one with a QR code that is different from the QR code that is shared by the other two devices).</li> <li>9. Verify that the MUD file that was retrieved from the MUD file server when this device was onboarded is <i>nist-model-fe_mycontroller.json</i>.</li> <li>10. Run test IoT-1-v4 using Device 2.</li> <li>11. Verify that the MUD file that was retrieved from the MUD file server when this device was onboarded is <i>nist-model-fe_manufacturer2.json</i>.</li> <li>12. Run test IoT-1-v4 using Device 3.</li> <li>13. Verify that no MUD file was retrieved but that the ACLs installed on the gateway that apply to this device are identical to the ACLs that were installed on the gateway for the second device (i.e., they enforce the MUD rules specified in <i>nist-model-fe_manufacturer2.json</i>).</li> </ul>

### 4.1.3 MUD Files

This section contains the MUD files that were used in the Build 4 functional demonstration.

#### 4.1.3.1 *nist-model-fe\_northsouth.json*

The complete *nist-model-fe\_northsouth.json* MUD file has been linked to this document. To access this MUD file, please click the link below.

[\*nist-model-fe\\_northsouth.json\*](#)

#### 4.1.3.2 *nist-model-fe\_mycontroller.json*

The complete *nist-model-fe\_mycontroller.json* MUD file has been linked to this document. To access this MUD file, please click the link below.

[\*nist-model-fe\\_mycontroller.json\*](#)

#### 4.1.3.3 *nist-model-fe\_controller\_anyport.json*

The complete *nist-model-fe\_controller\_anyport.json* MUD file has been linked to this document. To access this MUD file, please click the link below.

[\*nist-model-fe\\_controller\\_anyport.json\*](#)

#### 4.1.3.4 *nist-model-fe\_expiredcert.json*

The complete *nist-model-fe\_expiredcert.json* MUD file has been linked to this document. To access this MUD file, please click the link below.

[\*nist-model-fe\\_expiredcert.json\*](#)

#### 4.1.3.5 *nist-model-fe\_invalidsig.json*

The complete *nist-model-fe\_invalidsig.json* MUD file has been linked to this document. To access this MUD file, please click the link below.

[\*nist-model-fe\\_invalidsig.json\*](#)

#### 4.1.3.6 *nist-model-fe\_manufacturer1.json*

The complete *nist-model-fe\_manufacturer1.json* MUD file has been linked to this document. To access this MUD file, please click the link below.

[\*nist-model-fe\\_manufacturer1.json\*](#)

#### 4.1.3.7 *nist-model-fe\_manufacturer2.json*

The complete *nist-model-fe\_manufacturer2.json* MUD file has been linked to this document. To access this MUD file, please click the link below.

[\*nist-model-fe\\_manufacturer2.json\*](#)

#### 4.1.3.8 *nist-model-fe\_manufacturer-from.json*

The complete *nist-model-fe\_manufacturer-from.json* MUD file has been linked to this document. To access this MUD file, please click the link below.

[\*nist-model-fe\\_manufacturer-from.json\*](#)

#### 4.1.3.9 *nist-model-fe\_manufacturer-to.json*

The complete *nist-model-fe\_manufacturer-to.json* MUD file has been linked to this document. To access this MUD file, please click the link below.

[\*nist-model-fe\\_manufacturer-to.json\*](#)

#### 4.1.3.10 *nist-model-fe\_samemanufacturer.json*

The complete *nist-model-fe\_samemanufacturer.json* MUD file has been linked to this document. To access this MUD file, please click the link below.

[\*nist-model-fe\\_samemanufacturer.json\*](#)

#### 4.1.3.11 *nist-model-fe\_samemanufacturer-to.json*

The complete *nist-model-fe\_samemanufacturer-to.json* MUD file has been linked to this document. To access this MUD file, please click the link below.

[\*nist-model-fe\\_samemanufacturer-to.json\*](#)

#### 4.1.3.12 *nist-model-fe\_samemanufacturer-from.json*

The complete *nist-model-fe\_samemanufacturer-from.json* MUD file has been linked to this document. To access this MUD file, please click the link below.

[\*nist-model-fe\\_samemanufacturer-from.json\*](#)

#### 4.1.3.13 *nist-model-fe\_localnetwork\_anyport.json*

The complete *nist-model-fe\_localnetwork\_anyport.json* MUD file has been linked to this document. To access this MUD file, please click the link below.

[\*nist-model-fe\\_localnetwork\\_anyport.json\*](#)

## 4.2 Demonstration of Non-MUD-Related Capabilities

In addition to supporting MUD, Build 3 supports DPP onboarding and provides the capability to place devices onto specific micronets when they are provisioned on the network. Micronets are subnetworks that isolate devices. Devices that are on one Micronet are not able to exchange traffic with devices on other Micronets (unless overridden by their MUD files). Some Micronet classes have been predefined. When a device is onboarded using the DPP onboarding mobile application, the user is asked to input or confirm the class of Micronet to which the device should be assigned.

### 4.2.1 Non-MUD-Related Functional Capabilities

Table 4-11 lists the non-MUD-related capabilities that were demonstrated for Build 3. We use the letter “M” as a prefix for these functional capability identifiers in the table below because these capabilities are specific to Build 3, which uses Micronets technology. The lowercase “n” after the “M” is shorthand for “non-.” Hence, test MnMUD-1 is the first test to demonstrate the Micronets non-MUD capabilities.

**Table 4-11: Non-MUD-Related Functional Capabilities Demonstrated**

Functional Capability	Parent Capability	Subrequirement 1	Subrequirement 2	Exercise ID
M-1	<b>DPP onboarding</b> — The device can be onboarded to the network by using DPP.			MnMUD-1
M-1.a		The IoT device can be put into DPP onboarding mode, i.e., it can display a QR code and listen for DPP messages.	The QR code contains the bootstrapping information for the device.	MnMUD-1
M-1.b		The IoT device’s bootstrapping information can be conveyed to the DPP configurator.	The Micronets mobile application can act as the DPP configurator’s bootstrapping information reader by scanning the QR code and conveying its content to the configurator.	MnMUD-1
M-1.c		The DPP configurator can support the authentication phase of the DPP onboarding process.	The configurator initiates a three-way protocol exchange to authenticate the device (request, respond, confirm).	MnMUD-1

Functional Capability	Parent Capability	Subrequirement 1	Subrequirement 2	Exercise ID
M-1.d		The DPP configurator can support the configuration phase of the DPP onboarding process.	The configurator initiates a three-way protocol exchange to configure the device (request, respond, result) so that the device is provided with the Service Set Identifier (SSID) and credential it needs to connect to the local network.	MnMUD-1
M-2	<b>Network connection</b> —the device that has been onboarded with DPP can successfully connect to the network.			MnMUD-1
M-2.a		The device presents its credential to the network with the appropriate SSID.	The device is assigned an IP address on the appropriate network.	MnMUD-1
M-3	<b>Device Micronet classification</b> —Upon connection to the network, each device is placed into its intended Micronet class.			MnMUD-2
M-3.a		The Micronet class of each device can be provided as	The user specifies the device microne's class by using the onboarding	MnMUD-2

Functional Capability	Parent Capability	Subrequirement 1	Subrequirement 2	Exercise ID
		part of the bootstrapping information.	app on the mobile phone (after scanning the QR code).	
M-3.b		Devices that are in the same Micronet class can communicate with each other (assuming this is not contradicted by the devices' MUD files).		MnMUD-2
M-3.c		Devices that are in different Micronet classes cannot communicate with each other (assuming this is not contradicted by the devices' MUD files).		MnMUD-2
M-4	Each device that is onboarded using DPP is assigned a unique credential.			MnMUD-3
M-4.a		The Micronets Gateway can be configured to disconnect a device that has been onboarded using DPP.	The other devices remain connected.	MnMUD-3

#### 4.2.2 Exercises to Demonstrate the Above Non-MUD-Related Capabilities

This section contains the exercises that were performed to verify that Build 3 supports the non-MUD-related capabilities listed in Table 4-11.

#### 4.2.2.1 Exercise MnMUD-1

**Table 4-12: Exercise MnMUD-1**

Exercise Field	Description
Parent Capability	<p>(M-1) DPP onboarding—The device can be onboarded to the network by using DPP.</p> <p>(M-2) Network connection—The device that has been onboarded with DPP can successfully connect to the network.</p>
Subrequirement(s) of Parent Capability to Be Demonstrated	<p>(M-1.a) The IoT device can be put into DPP onboarding mode, i.e., it can display a QR code and listen for DPP messages. The QR code contains the bootstrapping information for the device.</p> <p>(M-1.b) The IoT device's bootstrapping information can be conveyed to the DPP configurator. The Micronets mobile application can act as the DPP configurator's bootstrapping information reader by scanning the QR code and conveying its content to the configurator.</p> <p>(M-1.c) The DPP configurator can support the authentication phase of the DPP onboarding process. The configurator initiates a three-way protocol exchange to authenticate the device (request, respond conform).</p> <p>(M-1.d) The DPP configurator can support the configuration phase of the DPP onboarding process. The configurator initiates a three-way protocol exchange to configure the device (request, respond, result) so that the device is provided with the SSID and credential it needs to connect to the local network.</p> <p>(M-2.a) The device presents its credential to the network with the appropriate SSID. The device is assigned an IP address on the appropriate network.</p>
Description	Demonstrate that a device can be onboarded using DPP and, once onboarded, the device can successfully connect to the appropriate network by using the credential that was provided to it during onboarding.
Associated Exercises	N/A

Exercise Field	Description
Associated Cybersecurity Framework Subcategory(ies)	ID.AM-1, ID.AM-2, ID.AM-3, DE.AE-1, DE.CM-1
IoT Device(s) Used	Raspberry Pi
Policy Used	N/A
Preconditions	<ol style="list-style-type: none"> <li>1. There are two DPP-capable devices available for use.</li> <li>2. All devices have been configured to use Ipv4.</li> <li>3. The gateway does not yet have any configuration settings pertaining to the IoT device being used in the test.</li> <li>4. The device being onboarded does not have a MUD file (or, if it does have a MUD file, the MUD file will not interfere with the device's ability to communicate with other devices that are on the same micronet or with the device's inability to communicate with devices that are on different micronets).</li> <li>5. In addition to the access point on the Micronets Gateway that is the correct network to which the device should connect, there is a second access point advertising an SSID of "incorrect network."</li> </ol>
Procedure	<ol style="list-style-type: none"> <li>1. Verify that the gateway for the IoT device to be used in the test does not yet have any configuration settings installed with respect to the IoT device being used in the test.</li> <li>2. Power on the IoT device.</li> <li>3. Wait a minute to verify that the device does not automatically connect to the network.</li> <li>4. Put the IoT device into DPP onboarding mode by clicking the + button. This will cause it to display a QR code and begin listening for DPP messages.</li> <li>5. Open the Micronets onboarding application on the mobile phone and click READY TO SCAN.</li> </ol>

Exercise Field	Description
	<ol style="list-style-type: none"> <li>6. Position the mobile phone's camera to read the device's QR code. Do this in a timely manner because there is a 60-second countdown for the device to exit DPP onboarding mode.</li> <li>7. Input additional device-specific information into the mobile onboarding application as requested (must be done within the same 60-second time limit): <ol style="list-style-type: none"> <li>a) Assign the device to a Micronets class (e.g., Generic).</li> <li>b) Give the device a unique name (e.g., Device 1).</li> </ol> </li> <li>8. Click the ONBOARD button on the mobile application. This causes the onboarding application to send the device's bootstrapping information to the DPP configurator on the gateway via the operator's MSO portal and cloud infrastructure.</li> <li>9. Wait. The following operations are being performed automatically in the operator's cloud infrastructure: <ol style="list-style-type: none"> <li>a) The Micronets Manager receives the bootstrapping info.</li> <li>b) The Micronets Manager provisions the device on the gateway.</li> <li>c) The device is onboarded via DPP.</li> <li>d) The device connects to the network.</li> </ol> </li> <li>10. View the logs on the gateway to verify that: <ol style="list-style-type: none"> <li>a) The DPP bootstrapping information was received at the DPP configurator.</li> <li>b) The authentication phase of DPP onboarding occurred for the device. (This is a three-way handshake—request, respond, confirm—between the configurator, which is in the gateway, and the device. The configurator initiates this exchange to authenticate the device and provide the device with a key to use to encrypt further communication. This three-way exchange occurs in the clear.)</li> <li>c) The configuration phase of DPP onboarding occurred for the device. (This is another three-way handshake—request, respond, result—between the configurator and the device. This is an encrypted exchange that the device initiates to learn the SSID of the correct network to which it should connect and its unique network credential.)</li> </ol> </li> </ol>

Exercise Field	Description
	<p>11. Verify that the device has been assigned an IP address on the correct network.</p> <p>12. Repeat all the above steps (1-11) for a second device, but this time call the device Device 2 in step 7b. Note that the second device should be assigned to the same Micronets class as the first device (e.g., Generic).</p> <p>13. At this point there should be two devices connected to the network, and they should be on the same micronet (micronet Generic). Verify that these two devices can send and receive messages to and from each other.</p>
Demonstrated Results	<p><b><u>Micronets Gateway and Micronets Manager logs verifying onboarding:</u></b></p> <p><b><u>Device 1:</u></b></p> <p>1. #### 4.2.2.2 Exercise MnMUD-2

**Table 4-13: Exercise MnMUD-2**

Exercise Field	Description
Parent Capability	(M-3) Device micronet classification—Upon connection to the network, each device is placed into its intended micronet class.
Subrequirement(s) of Parent Capability to Be Demonstrated	<p>(M-3.a) The micronet class of each device can be provided as part of the bootstrapping information. The user specifies the device micronets class by using the onboarding application on the mobile phone (after scanning the QR code).</p> <p>(M-3.b) Devices that are in the same micronet class can communicate with each other (assuming this is not contradicted by the devices' MUD files).</p> <p>(M-3.c) Devices that are in different micronet classes cannot communicate with each other (assuming this is not contradicted by the devices' MUD files).</p>
Description	Demonstrate that when each device is onboarded, the micronet class to which the device should be assigned can be provided so that when the device connects to the network, it will be located on the specified micronet. Also show that devices that are on the same micronet can communicate with each other, whereas devices that are on different micronets cannot (assuming that the devices do not have MUD files or, if they do have MUD files, the MUD files do not interfere with this behavior.)
Associated Exercises	MnMUD-1
Associated Cybersecurity Framework Subcategory(ies)	ID.AM-1, ID.AM-2, ID.AM-3, DE.AE-1, DE.CM-1
IoT Device(s) Used	Raspberry Pi
Policy Used	N/A

Exercise Field	Description
Preconditions	All the same preconditions as Exercise MnMUD-1, except that for this test, three DPP-capable devices are available for use instead of just two.
Procedure	<ol style="list-style-type: none"> <li>1. Run Exercise MnMUD-1.</li> <li>2. At this point, there should be two devices connected to the correct network (Device 1 and Device 2), and they should be on the same micronet (Medical).</li> <li>3. Perform steps 1-12 of Exercise MnMUD-1 for a third device, but this time assign the device the micronet class Personal in step 7a, and call the device Device 3 in step 7b.</li> <li>4. Verify that Device 1 and Device 2 (which are both on Medical micronet class) can send and receive messages to and from each other.</li> <li>5. Verify that neither Device 1 nor Device 2 can send or receive messages to or from Device 3 (which is on Personal micronet class).</li> </ol>

### 4.2.2.3 Exercise MnMUD-3

**Table 4-14: Exercise MnMUD-3**

Exercise Field	Description
Parent Capability	(M-4) Each device that is onboarded using DPP is assigned a unique credential.
Subrequirement(s) of Parent Capability to Be Demonstrated	(M-4.a) The Micronets Gateway can be configured to disconnect a device that has been onboarded using DPP. The other devices remain connected.
Description	Demonstrate that if multiple devices have been onboarded, the gateway can be configured to revoke the credential of one of the devices, causing it to be disconnected. But the other devices, which have their own unique credentials, will remain connected.
Associated Exercises	MnMUD-1
Associated Cybersecurity Framework Subcategory(ies)	ID.AM-1, ID.AM-2, ID.AM-3, DE.AE-1, DE.CM-1
IoT Device(s) Used	Raspberry Pi
Policy Used	N/A
Preconditions	All the same preconditions as Exercise MnMUD-1, except that for this test, three DPP-capable devices are available for use instead of just two.
Procedure	<ol style="list-style-type: none"> <li>1. Run Exercise MnMUD-1.</li> <li>2. At this point, there should be two devices connected to the correctnetwork (Device 1 and Device 2), and they should be on the same Micronet (CLASS 1).</li> <li>3. Perform steps 1-12 of Exercise MnMUD-1 for a third device, assigning the device the same Micronet class (CLASS 1) in step 7a</li> </ol>

Exercise Field	Description
	<p>as the other two devices, and call the device Device 3 in step 7b.</p> <ol style="list-style-type: none"> <li>4. Verify that Device 1, Device 2, and Device 3 (which are all on Micronet CLASS 1) can send and receive messages to and from one another.</li> <li>5. Configure the gateway to disconnect Device 2.</li> <li>6. Verify that Device 2 cannot send messages to or receive messages from Device 1 or Device 3.</li> <li>7. Verify that Device 1 and Device 3 can send messages to and from each other.</li> </ol>
Demonstrated Results	<p><b><u>Get micronets before deleting single device:</u></b></p> <pre>{   "_id": "5ee7bf78ab3e8358c185e759",   "id": "subscriber-001",   "name": "Subscriber 001",   "ssid": "micronets-gw",   "gatewayId": "micronets-gw",   "micronets": [     {       "name": "Medical",       "class": "Medical",       "micronet-subnet-id": "Medical",       "trunk-gateway-port": "2",       "trunk-gateway-ip": "10.36.32.124",       "dhcp-server-port": "LOCAL",       "dhcp-zone": "10.135.2.0/24",       "ovs-bridge-name": "brmn001",       "ovs-manager-ip": "10.36.32.124",       "micronet-subnet": "10.135.2.0/24",       "micronet-gateway-ip": "10.135.2.1",       "connected-devices": [         {           "device-mac": "00:C0:CA:97:D1:1F",           "device-name": "Pi1-nm3",           "device-id": "463165abc19725aefffc39def13ce09b17167fba",           "device-openflow-port": "2",           "device-ip": "10.135.2.2"         },         {           "device-mac": "00:C0:CA:98:42:37",           "device-name": "Pi2-nm3",           "device-id": "9f58599efce4680ee0c21efe0b98e27f8a7a8958", </pre>

## 5 Build 4

Build 4 uses software developed at the NIST Advanced Networking Technologies Laboratory. This software provides support for MUD and is intended to serve as a working prototype of the MUD RFC to demonstrate feasibility and scalability.

### 5.1 Evaluation of MUD-Related Capabilities

The functional evaluation that was conducted to verify that Build 4 conforms to the MUD specification was based on the Build 4-specific requirements listed in Table 5-1.

#### 5.1.1 Requirements

**Table 5-1: MUD Use Case Functional Requirements**

Capability Requirement (CR)-ID	Parent Requirement	Subrequirement 1	Subrequirement 2	Test Case
CR-1	The IoT DDoS example implementation shall include a mechanism for associating a device with a MUD file URL (e.g., by having the MUD-enabled <b>IoT device emit a MUD file URL via DHCP, LLDP, or X.509 or by using some other mechanism to enable the network to associate a device with a MUD file URL</b> ).			IoT-1-v4, IoT-11-v4

Capability Requirement (CR)-ID	Parent Requirement	Subrequirement 1	Subrequirement 2	Test Case
CR-1.a		Upon initialization, the MUD-enabled IoT device shall broadcast a DHCP message on the network, including at most one <b>MUD URL, in https scheme, within the DHCP transaction.</b>		IoT-1-v4, IoT-11-v4
CR-1.a.1			The DHCP server shall be able to receive <b>DHCPv4 DISCOVER and REQUEST with IANA code 161 (OPTION_MUD_URL_V4)</b> from the MUD-enabled IoT device.	IoT-1-v4, IoT-11-v4
CR-2	The IoT DDoS example implementation shall include the capability for the extracted MUD URL <b>to be provided to a MUD manager.</b>			IoT-1-v4
CR-2.a		The DHCP server shall <b>assign an IP address lease</b> to the MUD-enabled IoT device.		IoT-1-v4

Capability Requirement (CR)-ID	Parent Requirement	Subrequirement 1	Subrequirement 2	Test Case
CR-2.a.1			The MUD-enabled IoT device shall <b>re-ceive the IP ad-dress</b> .	IoT-1-v4
CR-2.b		<b>The MUD manager</b> shall receive the DHCP message and <b>extract the MUD URL</b> .		IoT-1-v4
CR-2.b.1			<b>The MUD manager shall receive the MUD URL</b> .	IoT-1-v4
CR-3	The IoT DDoS example im-plementation shall include a <b>MUD manager that can re-request a MUD file and signa-ture from a MUD file server</b> .			IoT-1-v4
CR-3.a		The MUD manager shall use the GET method (RFC 7231) to <b>request MUD and signature files</b> (per RFC 7230) from the MUD file server and can <b>validate the MUD file server's TLS certificate</b> by using the rules in RFC 2818.		IoT-1-v4

Capability Requirement (CR)-ID	Parent Requirement	Subrequirement 1	Subrequirement 2	Test Case
CR-3.a.1			<b>The MUD file server shall receive the https request from the MUD manager.</b>	IoT-1-v4
CR-3.b		<b>The MUD manager</b> shall use the GET method (RFC 7231) to request MUD and signature files (per RFC 7230) from the MUD file server, but it <b>cannot validate the MUD file server's TLS certificate</b> by using the rules in RFC 2818.		IoT-2-v4
CR-3.b.1			<b>The MUD manager shall drop the connection</b> to the MUD file server.	IoT-2-v4
CR-3.b.2			<b>The MUD manager shall send locally defined policy to the router or switch</b> that handles whether to allow or block traffic to and from the MUD-enabled IoT device.	IoT-2-v4
CR-4	The IoT DDoS example implementation shall include a <b>MUD file server that can</b>			IoT-1-v4

Capability Requirement (CR)-ID	Parent Requirement	Subrequirement 1	Subrequirement 2	Test Case
	serve a MUD file and signature to the MUD manager.			
CR-4.a		The MUD file server shall serve the file and signature to the MUD manager, and the MUD manager shall check to determine whether the certificate used to sign the MUD file (signed using DER-encoded CMS [RFC 5652]) was valid at the time of signing, i.e., the <b>certificate had not expired</b> .		IoT-1-v4
CR-4.b		The MUD file server shall serve the file and signature to the MUD manager, and the MUD manager shall check to determine whether the certificate used to sign the MUD file was valid at the time of signing, i.e., the <b>certificate had already expired when it was used to sign the MUD file</b> .		IoT-3-v4

Capability Requirement (CR)-ID	Parent Requirement	Subrequirement 1	Subrequirement 2	Test Case
CR-4.b.1			The MUD manager shall cease to process the MUD file.	IoT-3-v4
CR-4.b.2			The MUD manager shall send locally defined policy to the router or switch that handles whether to allow or block traffic to and from the MUD-enabled IoT device.	IoT-3-v4
CR-5	The IoT DDoS example implementation shall include a <b>MUD manager that can translate local network configurations based on the MUD file.</b>			IoT-1-v4
CR-5.a		<b>The MUD manager shall successfully validate the signature of the MUD file.</b>		IoT-1-v4
CR-5.a.1			The MUD manager, after validation of the MUD file signature, shall <b>check for an existing MUD file, and translate abstractions in the MUD file to router</b>	IoT-1-v4

Capability Requirement (CR)-ID	Parent Requirement	Subrequirement 1	Subrequirement 2	Test Case
			<b>or switch configurations.</b>	
CR-5.a.2			The MUD manager shall <b>cache</b> this newly received MUD file.	IoT-10-v4
CR-5.b		The MUD manager shall attempt to validate the signature of the <b>MUD file</b> , but the <b>signature validation fails</b> (even though the certificate that had been used to create the signature had not been expired at the time of signing, i.e., the signature is invalid for a different reason).		IoT-4-v4
CR-5.b.1			<b>The MUD manager shall cease processing the MUD file.</b>	IoT-4-v4

CR-10.a.1			<b>The router or switch shall receive the attempt and shall deny it</b> based on the filters from the MUD file.	IoT-6-v4
CR-10.b		<b>An unapproved</b> (implicitly denied) <b>device shall attempt to initiate a lateral connection</b> to the MUD-enabled IoT device.		IoT-6-v4
CR-10.b.1			<b>The router or switch shall receive the attempt and shall deny it</b> based on the	IoT-6-v4

Capability Requirement (CR)-ID	Parent Requirement	Subrequirement 1	Subrequirement 2	Test Case
			filters from the MUD file.	
CR-11	If the IoT DDoS example implementation is such that its DHCP server does not act as a MUD manager and it forwards a MUD URL to a MUD manager, <b>the DHCP server must notify the MUD manager of any corresponding change to the DHCP state</b> of the MUD-enabled IoT device, and the MUD manager should <b>remove the implemented policy configuration in the router/switch pertaining to that MUD-enabled IoT device</b> .			No test needed because the DHCP server does not forward the MUD URL to the MUD manager, as intended.
CR-11.a		The MUD-enabled IoT <b>device shall explicitly release the IP address lease</b> (i.e., it sends a DHCP release message to the DHCP server).		N/A
CR-11.a.1			<b>The DHCP server shall notify the MUD manager that the device's IP address lease has been released.</b>	N/A

Capability Requirement (CR)-ID	Parent Requirement	Subrequirement 1	Subrequirement 2	Test Case
CR-11.a.2			<b>The MUD manager should remove all policies</b> associated with the disconnected IoT device that had been configured on the MUD PEP router/switch.	N/A
CR-11.b		The MUD-enabled IoT <b>device's IP address lease shall expire.</b>		N/A
CR-11.b.1			<b>The DHCP server shall notify the MUD manager that the device's IP address lease has expired.</b>	N/A
CR-11.b.2			<b>The MUD manager should remove all policies</b> associated with the affected IoT device that had been configured on the MUD PEP router/switch.	N/A
CR-12	The IoT DDoS example implementation shall include a <b>MUD manager that uses a cached MUD file rather than retrieve a new one if</b>			IoT-10-v4

Capability Requirement (CR)-ID	Parent Requirement	Subrequirement 1	Subrequirement 2	Test Case
	<b>the cache-validity time period has not yet elapsed</b> for the MUD file indicated by the MUD URL. <b>The MUD manager should fetch a new MUD file if the cache-validity time period has already elapsed.</b>			
CR-12.a		The MUD manager shall check if the file associated with the <b>MUD URL is present in its cache</b> and shall determine that it is.		IoT-10-v4
CR-12.a.1			The MUD manager shall <b>check whether the amount of time that has elapsed since the cached file was retrieved is less than or equal to the number of hours in the cache-validity value for this MUD file</b> . If so, the MUD manager shall apply the contents of the cached MUD file.	IoT-10-v4
CR-12.a.2			The MUD manager shall <b>check whether the amount of time that has elapsed</b>	IoT-10-v4

Capability Requirement (CR)-ID	Parent Requirement	Subrequirement 1	Subrequirement 2	Test Case
			since the cached file was retrieved is greater than the number of hours in the cache-validity value for this MUD file. If so, the MUD manager may (but does not have to) fetch a new file by using the MUD URL received.	
CR-13	The IoT DDoS example implementation shall ensure that for each rule in a MUD file that pertains to an external domain, the MUD PEP router/switch will get configured with <b>all possible instantiations of that rule</b> , insofar as <b>each instantiation contains one of the IP addresses to which the domain in that MUD file rule may be resolved when queried by the MUD PEP router/switch</b> .			IoT-9-v4
CR-13.a		The MUD file for a device shall contain a rule involving a <b>domain that can resolve to multiple IP</b>		IoT-9-v4

Capability Requirement (CR)-ID	Parent Requirement	Subrequirement 1	Subrequirement 2	Test Case
		<b>addresses</b> when queried by the MUD PEP router/switch. <b>Flow rules for permitting access to each of those IP addresses will be inserted into the MUD PEP router/switch</b> for the device in question, and the device will be permitted to communicate with all of those IP addresses.		
CR-13.a.1			IPv4 addressing is used on the network.	IoT-9-v4

### 5.1.2 Test Cases

This section contains the test cases that were used to verify that Build 4 met the requirements listed in Table 5-1.

The test setup consists of five Raspberry Pis. Two of these are designated as having MUD Uniform Resource Identifiers (URIs) *sensor.nist.local* and one is designated *otherman.nist.local*. MUD files for “sensor” and “otherman” were generated using mudmaker. The software-defined networking (SDN) enabled wireless router/NAT maps these fake hosts to test servers that are on the public side of the NAT. They are given fake 203.0.113.x addresses for name resolution. One of the Raspberry Pis is designated as a controller, and the last Raspberry Pi is designated as a host on the “local network.”

The SDN switch is an unmodified Northbound Networks wireless SDN switch.

The controller host address and the DNS/DHCP host address are configured statically in the SDN controller by using the standard URIs for these entities. The controller URIs for the devices are likewise configured. dhclient is used to issue DHCP requests with MUD URLs embedded for Raspberry Pis 1, 2, and 3.

The MUD URIs for 1 and 2 are identical and set to *https://sensor.nist.local/nistmud1*, while the MUD URI for Pi 3 is set to *https://otherman.nist.local/nistmud2*.

The controller host maps the fake host names in these URIs to 127.0.0.1 and runs a manufacturer https server. The server logs access to verify if file caching is properly working on the MUD manager.

Before the tests are conducted, the MUD files are signed using the NCCoE-supplied DigiCert key, and the trusted certificate is installed in the Java virtual machine trust store.

Accessibility testing is done using simple scripts and command line utilities that test whether permissible access works and whether forbidden access is blocked by the MUD-enabled SDN switch. The MUD files have access control entries that enable testing interactions with the hosts and web servers.

#### 5.1.2.1 Test Case IoT-1-v4

**Table 5-2: Test Case IoT-1-v4**

Test Case Field	Description
Parent Requirements	<p>(CR-1) The IoT DDoS example implementation shall include a mechanism for associating a device with a MUD file URL (e.g., by having the MUD-enabled IoT device emit a MUD file URL via DHCP, LLDP, or X.509 or by using some other mechanism to enable the network to associate a device with a MUD file URL).</p> <p>(CR-2) The IoT DDoS example implementation shall include the capability for the MUD URL to be provided to a MUD manager.</p> <p>(CR-3) The IoT DDoS example implementation shall include a MUD manager that can request a MUD file and signature from a MUD file server.</p> <p>(CR-4) The IoT DDoS example implementation shall include a MUD file server that can serve a MUD file and signature to the MUD manager.</p> <p>(CR-5) The IoT DDoS example implementation shall include a MUD manager that can translate local network configurations based on the MUD file.</p> <p>(CR-6) The IoT DDoS example implementation shall include a MUD manager that can configure the router or switch nearest the MUD-enabled IoT device that emitted the URL.</p>
Testable Requirements	<p>(CR-1.a) Upon initialization, the MUD-enabled IoT device shall broadcast a DHCP message on the network, including at most one MUD URL, in https scheme, within the DHCP transaction.</p>

Test Case Field	Description
	<p>(CR-1.a.1) The DHCP server shall be able to receive DHCPv4 DISCOVER and REQUEST with IANA code 161 (OPTION_MUD_URL_V4) from the MUD-enabled IoT device.</p> <p>(CR-2.a) The DHCP server shall assign an IP address lease to the MUD-enabled IoT device.</p> <p>(CR-2.a.1) The MUD-enabled IoT device shall receive the IP address.</p> <p>(CR-2.b) The MUD manager shall receive the DHCP message and extract the MUD URL.</p> <p>(CR-2.b.1) The MUD manager shall receive the MUD URL.</p> <p>(CR-3.a) The MUD manager shall use the GET method (RFC 7231) to request MUD and signature files (per RFC 7230) from the MUD file server and can validate the MUD file server's TLS certificate by using the rules in RFC 2818.</p> <p>(CR-3.a.1) The MUD file server shall receive the https request from the MUD manager.</p> <p>(CR-4.a) The MUD file server shall serve the file and signature to the MUD manager, and the MUD manager shall check to determine whether the certificate used to sign the MUD file (signed using DER-encoded CMS [RFC 5652]) was valid at the time of signing, i.e., the certificate had not expired.</p> <p>(CR-5.a) The MUD manager shall successfully validate the signature of the MUD file.</p> <p>(CR-5.a.1) The MUD manager, after validation of the MUD file signature, shall check for an existing MUD file and translate abstractions in the MUD file to router or switch configurations.</p> <p>(CR-6.a) The MUD manager shall install a router configuration on the router or switch nearest the MUD-enabled IoT device that emitted the URL.</p> <p>(CR-6.a.1) The router or switch shall have been configured to enforce the route filter sent by the MUD manager.</p>
Description	<p>Shows that, upon connection to the network, a MUD-enabled IoT device used in the IoT DDoS example implementation has its MUD PEP router/switch automatically configured to enforce the route filtering that is described in the device's MUD file, assuming the MUD file has a valid signature and is served from a MUD file server that has a valid TLS certificate</p>

Test Case Field	Description
Associated Test Case(s)	N/A
Associated Cybersecurity Framework Subcategory(ies)	ID.AM-1, ID.AM-2, ID.AM-3, PR.DS-5, DE.AE-1, PR.AC-4, PR.AC-5, PR.IP-1, PR.IP-3, PR.PT-3, PR.DS-2
IoT Device(s) Under Test	Raspberry Pi
MUD File(s) Used	<i>mudfile-sensor.json</i>
Preconditions	<ol style="list-style-type: none"> <li>1. All devices have been configured to use IPv4.</li> <li>2. This MUD file is not currently cached at the MUD manager.</li> <li>3. The device's MUD file has a valid signature that was signed by a certificate that had not yet expired, and it is being hosted on a MUD file server that has a valid TLS certificate.</li> <li>4. The MUD PEP router/switch does not yet have any configuration settings pertaining to the IoT device being used in the test.</li> <li>5. The MUD file for the IoT device being used in the test is identical to the MUD file provided in <a href="#">Section 5.1.3</a>.</li> </ol>
Procedure	<p>Verify that the MUD PEP router/switch for the IoT device to be used in the test does not yet have any configuration settings installed with respect to the IoT device being used in the test. Also verify that the MUD file of the IoT device to be used is not currently cached at the MUD manager.</p> <ol style="list-style-type: none"> <li>1. Power on the IoT device and connect it to the test network.</li> <li>2. On the IoT device, using the dhclient application with appropriate configuration file, manually send a DHCPv4 message containing the device's MUD URL (IANA code 161).</li> <li>3. The DHCP server receives the DHCP message containing the IoT device's MUD URL.</li> <li>4. The MUD manager snoops the DHCP request through the switch and extracts the MUD URL from the DHCP request.</li> </ol>

Test Case Field	Description
	<ol style="list-style-type: none"> <li>5. The MUD manager automatically contacts the MUD file server that is located by using the MUD URL, verifies that it has a valid TLS certificate, requests and receives the MUD file and signature from the MUD file server, validates the MUD file's signature, and translates the MUD file's contents into appropriate route filtering rules. It then installs these rules onto the MUD PEP for the IoT device in question so that this router/switch is now configured to enforce the policies specified in the MUD file.</li> <li>6. The DHCP server offers an IP address lease to the newly connected IoT device.</li> <li>7. The IoT device requests this IP address lease, which the DHCP server acknowledges.</li> </ol>
Expected Results	The MUD PEP router/switch for the IoT device has had its configuration changed, i.e., it has been configured to enforce the policies specified in the IoT device's MUD file. Flow rules on the switch are updated to reflect MUD filtering rules. The flow rules in the MUD flow rules table should reflect the ACLs in the MUD file.
Actual Results	<p><b><u>Flow rules on router/switch:</u></b></p> <p>As seen below, tables zero and one classify the packets based on source and destination address, and tables two and three implement the MUD rules filtering. Tables four and five are pass and drop tables respectively. Additionally, to simplify, this test is successful when flows other than the default flows are viewed on the MUD PEP router/switch.</p> <pre> OFPST_FLOW reply (OF1.3) (xid=0x2):   cookie=0x995ac, duration=38.664s, table=0, n_packets=12,   n_bytes=996, idle_timeout=120, hard_timeout=240, priority=40, ip, dl_src=00:13:ef:20:1d:14 actions=write_metadata:0x1003003000000000/0x7fffffff00000000, got   o_table:1   cookie=0x995ac, duration=38.148s, table=0, n_packets=12,   n_bytes=996, idle_timeout=120, hard_timeout=240, priority=40, ip, dl_src=00:13:ef:70:47:66 actions=write_metadata:0x1003003000000000/0x7fffffff00000000, got   o_table:1 </pre>

Overall Results	Pass

IPv6 is not supported in this implementation.

#### 5.1.2.2 Test Case IoT-2-v4

**Table 5-3: Test Case IoT-2-v4**

Test Case Field	Description
Parent Requirement	(CR-3) The IoT DDoS example implementation shall include a MUD manager that can request a MUD file and signature from a MUD file server.

Test Case Field	Description
Testable Requirement	<p>(CR-3.b) The MUD manager shall use the GET method (RFC 7231) to request MUD and signature files (per RFC 7230) from the MUD file server, but it cannot validate the MUD file server's TLS certificate by using the rules in RFC 2818.</p> <p>(CR-3.b.1) The MUD manager shall drop the connection to the MUD file server.</p> <p>(CR-3.b.2) The MUD manager shall send locally defined policy to the router or switch that handles whether to allow or block traffic to and from the MUD-enabled IoT device.</p>
Description	Shows that if a MUD manager cannot validate the TLS certificate of a MUD file server when trying to retrieve the MUD file for a specific IoT device, the MUD manager will drop the connection to the MUD file server and configure the router/switch according to locally defined policy regarding whether to allow or block traffic to the IoT device in question.
Associated Test Case(s)	IoT-11-v4
Associated Cybersecurity Framework Subcategory(ies)	PR.AC-7
IoT Device(s) Under Test	Raspberry Pi
MUD File(s) Used	<i>mudfile-sensor.json</i>
Preconditions	<ol style="list-style-type: none"> <li>1. All devices have been configured to use IPv4.</li> <li>2. This MUD file is not currently cached at the MUD manager.</li> <li>3. The MUD file server that is hosting the MUD file of the device under test does not have a valid TLS certificate.</li> <li>4. Local policy has been defined to ensure that if the MUD file for a device is located on a server with an invalid certificate, the router/switch will be configured to deny all communication to and</li> </ol>

Test Case Field	Description
	<p>from the IoT device except standard network services (DHCP, DNS, network time protocol [NTP]).</p> <p>5. The MUD PEP router/switch for the IoT device to be used in the test does not yet have any configuration settings with respect to the IoT device being used in the test.</p>
Procedure	<p>Verify that the MUD PEP router/switch for the IoT device to be used in the test does not yet have any configuration settings installed with respect to the IoT device being used in the test.</p> <ol style="list-style-type: none"> <li>1. Power on the IoT device and connect it to the test network.</li> <li>2. On the IoT device, using the dhclient application with appropriate configuration file, manually emit a DHCPv4 message containing the device's MUD URL (IANA code 161).</li> <li>3. The MUD manager snoops the DHCP request through the switch and extracts the MUD URL from the DHCP request.</li> <li>4. The DHCP server receives the DHCP message containing the IoT device's MUD URL.</li> <li>5. The DHCP server offers an IP address lease to the newly connected IoT device.</li> <li>6. The IoT device requests this IP address lease, which the DHCP server acknowledges.</li> <li>7. The MUD manager automatically contacts the MUD file server that is located by using the MUD URL, determines that it does not have a valid TLS certificate, and drops the connection to the MUD file server.</li> <li>8. The MUD manager configures the router/switch that is closest to the IoT device so that it denies all communications to and from the IoT device except for standard network services (DHCP, DNS, NTP).</li> </ol>
Expected Results	<p>The MUD PEP router/switch for the IoT device has had its configuration changed, i.e., it has been configured to local policy for communication to/from the IoT device. Only standard network services are to be allowed (DHCP, DNS, NTP)—this is the standard policy on MUD file verification failures.</p>

IPv6 is not supported in this implementation.

#### 5.1.2.3 Test Case IoT-3-v4

**Table 5-4: Test Case IoT-3-v4**

Test Case Field	Description
Parent Requirement	(CR-4) The IoT DDoS example implementation shall include a MUD file server that can serve a MUD file and signature to the MUD manager.

Test Case Field	Description
Testable Requirement	<p>(CR-4.b) The MUD file server shall serve the file and signature to the MUD manager, and the MUD manager shall check to determine whether the certificate used to sign the MUD file was valid at the time of signing, i.e., the certificate had already expired when it was used to sign the MUD file.</p> <p>(CR-4.b.1) The MUD manager shall cease to process the MUD file.</p> <p>(CR-4.b.2) The MUD manager shall send locally defined policy to the router or switch that handles whether to allow or block traffic to and from the MUD-enabled IoT device.</p>
Description	Shows that if a MUD file server serves a MUD file with a signature that was created with an expired certificate, the MUD manager will cease processing the MUD file.
Associated Test Case(s)	IoT-11-v4
Associated Cybersecurity Framework Subcategory(ies)	PR.DS-6
IoT Device(s) Under Test	Raspberry Pi
MUD File(s) Used	<i>mudfile-sensor.json</i>
Preconditions	<ol style="list-style-type: none"> <li>1. All devices have been configured to use IPv4.</li> <li>2. This MUD file is not currently cached at the MUD manager.</li> <li>3. Overall Results	Pass

IPv6 is not supported in this implementation.

#### 5.1.2.4 Test Case IoT-4-v4

**Table 5-5: Test Case IoT-4-v4**

Test Case Field	Description
Parent Requirement	(CR-5) The IoT DDoS example implementation shall include a MUD manager that can translate local network configurations based on the MUD file.
Testable Requirement	<p>(CR-5.b) The MUD manager shall attempt to validate the signature of the MUD file, but the signature validation fails (even though the certificate that had been used to create the signature had not been expired at the time of signing, i.e., the signature is invalid for a different reason).</p> <p>(CR-5.b.1) The MUD manager shall cease processing the MUD file.</p> <p>(CR-5.b.2) The MUD manager shall send locally defined policy to the router or switch that handles whether to allow or block traffic to and from the MUD-enabled IoT device.</p>
Description	Shows that if the MUD manager determines that the signature on the MUD file it receives from the MUD file server is invalid, it will cease processing the MUD file and configure the router/switch according to locally defined policy regarding whether to allow or block traffic to the IoT device in question.
Associated Test Case(s)	IoT-11-v4
Associated Cybersecurity Framework Subcategory(ies)	PR.DS-6
IoT Device(s) Under Test	Raspberry Pi
MUD File(s) Used	<i>mudfile-sensor.json</i>
Preconditions	<ol style="list-style-type: none"> <li>1. All devices have been configured to use IPv4.</li> <li>2. This MUD file is not currently cached at the MUD manager.</li> <li>3. The MUD file that is served from the MUD file server to the MUD manager has a signature that is invalid, even though it was signed by a certificate that had not expired at the time of signing.</li> </ol>

Test Case Field	Description
	<ol style="list-style-type: none"> <li>Local policy has been defined to ensure that if the MUD file for a device has an invalid signature, the device's MUD PEP router/switch will be configured to deny all communications to/from the device except for standard network services (DHCP, DNS, NTP).</li> <li>The MUD PEP router/switch does not yet have any configuration settings with respect to the IoT device being used in the test.</li> </ol>
Procedure	<p>Verify that the MUD PEP router/switch for the IoT device to be used in the test does not yet have any configuration settings installed with respect to the IoT device being used in the test.</p> <ol style="list-style-type: none"> <li>Power on the IoT device and connect it to the test network.</li> <li>On the IoT device, using the dhclient application with appropriate configuration file, manually emit a DHCPv4 message containing the device's MUD URL (IANA code 161).</li> <li>The MUD manager snoops the DHCP request through the switch and extracts the MUD URL from the DHCP request.</li> <li>The DHCP server receives the DHCP message containing the IoT device's MUD URL.</li> <li>The DHCP server offers an IP address lease to the newly connected IoT device.</li> <li>The IoT device requests this IP address lease, which the DHCP server acknowledges.</li> <li>The MUD manager automatically contacts the MUD file server that is located by using the MUD URL, verifies that it has a valid TLS certificate, and requests the MUD file and signature from the MUD file server.</li> <li>The MUD file server sends the MUD file, and the MUD manager detects that the MUD file's signature is invalid.</li> <li>The MUD manager configures the router/switch that is closest to the IoT device so that it denies all communications to and from the IoT device except standard network services (DHCP, DNS, NTP).</li> </ol>

Test Case Field	Description
Expected Results	The MUD PEP router/switch for the IoT device has had its configuration changed, i.e., it has been configured to local policy for communication to/from the IoT device. Only standard network services are to be allowed (DHCP, DNS, NTP)—this is the standard policy on MUD file verification failures.
Actual Results	<p><b><u>IoT device before DHCP request:</u></b></p> <pre>python get-src-mac-metadata.py -m 00:13:EF:20:1D:6B {   "input": {     "mac-address": "00:13:EF:20:1D:6B"   } } {   "output": {     "src-local-networks-flag": true,     "src-quarantine-flag": false,     "src-blocked-flag": false,     "src-model": "UNCLASSIFIED",     "src-manufacturer": "UNCLASSIFIED",     "metadata": "100300300000000"   } }</pre> <p><b><u>MUD manager logs—exception when there is an issue with MUD file:</u></b></p> <pre>MudfileFetcher: fetchAndInstall : MUD URL = https://sensor.nist.local/nistmud1 2019-09-03 14:41:34,114   ERROR   n-dispatcher-232   Mud- FileFetcher   93 - gov.nist.anttd.sdnmud-impl - 0.1.0   Error fetching MUD file -- not installing org.apache.http.conn.HttpHostConnectException: Connect to sensor.nist.local:443 [sensor.nist.local/127.0.0.1] failed: Connection refused (Connection refused)     at org.apache.http.impl.conn.DefaultHttpClientConne- ctionOperator.connect(DefaultHttpClientConnectionOpera- tor.java:159) [379:wrap_file__home_mudmanager_nist- mud_sdnmud-aggregator_karaf_target_assembly_sys- tem_org_apache_httpcomponents_httpclient_4.5.5_httpclient- 4.5.5.jar:0.0.0]     at org.apache.http.impl.conn.PoolingHttpClientConne- ctionManager.connect(PoolingHttpClientConnectionMan- ager.java:373) [379:wrap_file__home_mudmanager_nist- mud_sdnmud-aggregator_karaf_target_assembly_sys- tem_org_apache_httpcomponents_httpclient_4.5.5_httpclient- 4.5.5.jar:0.0.0]</pre>

Overall Results	Pass

IPv6 is not supported in this implementation.

#### 5.1.2.5 Test Case IoT-5-v4

**Table 5-6: Test Case IoT-5-v4**

Test Case Field	Description
Parent Requirement	<p>(CR-7) The IoT DDoS example implementation shall allow the MUD-enabled IoT device to communicate with approved internet services in the MUD file.</p> <p>(CR-8) The IoT DDoS example implementation shall deny communications from a MUD-enabled IoT device to unapproved internet services (i.e., services that are implicitly denied by virtue of not being explicitly approved).</p>
Testable Requirement	<p>(CR-7.a) The MUD-enabled IoT device shall attempt to initiate outbound traffic to approved internet services.</p> <p>(CR-7.a.1) The router or switch shall receive the attempt and shall allow it to pass based on the filters from the MUD file.</p> <p>(CR-7.b) An approved internet service shall attempt to initiate a connection to the MUD-enabled IoT device.</p> <p>(CR-7.b.1) The router or switch shall receive the attempt and shall allow it to pass based on the filters from the MUD file.</p> <p>(CR-8.a) The MUD-enabled IoT device shall attempt to initiate outbound traffic to unapproved (implicitly denied) internet services.</p> <p>(CR-8.a.1) The router or switch shall receive the attempt and shall deny it based on the filters from the MUD file.</p> <p>(CR-8.b) An unapproved (implicitly denied) internet service shall attempt to initiate a connection to the MUD-enabled IoT device.</p> <p>(CR-8.b.1) The router or switch shall receive the attempt and shall deny it based on the filters from the MUD file.</p> <p>(CR-8.c) The MUD-enabled IoT device shall initiate communications to an internet service that is approved to initiate communications with the MUD-enabled device but not approved to receive communications initiated by the MUD-enabled device.</p> <p>(CR-8.c.1) The router or switch shall receive the attempt and shall deny it based on the filters from the MUD file.</p> <p>(CR-8.d) An internet service shall initiate communications to a MUD-enabled device that is approved to initiate communications with the internet service but that is not approved to receive communications initiated by the internet service.</p> <p>(CR-8.d.1) The router or switch shall receive the attempt and shall deny it based on the filters from the MUD file.</p>

Test Case Field	Description
Description	Shows that, upon connection to the network, a MUD-enabled IoT device used in the IoT DDoS example implementation has its MUD PEP router/switch automatically configured to enforce the route filtering that is described in the device's MUD file with respect to communication with internet services. Further shows that the policies that are configured on the MUD PEP router/switch with respect to communication with internet services will be enforced as expected, with communications that are configured as denied being blocked, and communications that are configured as permitted being allowed.
Associated Test Case(s)	IoT-1-v4
Associated Cybersecurity Framework Subcategory(ies)	ID.AM-3, PR.DS-5, PR.IP-1, PR.PT-3
IoT Device(s) Under Test	Raspberry Pi
MUD File(s) Used	<i>mudfile-sensor.json, mudfile-otherman.json</i>
Preconditions	<p>Test IoT-1-v4 has run successfully, meaning that the MUD PEP router/switch has been configured to enforce the following policies for the IoT device in question (as defined in the MUD file in Section 5.1.3):</p> <ul style="list-style-type: none"> <li>a) Explicitly permit <i>https://yes-permit-from.com</i> to initiate communications with the IoT device.</li> <li>b) Explicitly permit the IoT device to initiate communications with <i>https://yes-permit-to.com</i>.</li> <li>c) Implicitly deny all other communications with the internet, including denying: <ul style="list-style-type: none"> <li>i) the IoT device to initiate communications with <i>https://yes-permit-from.com</i></li> <li>ii) <i>https://yes-permit-to.com</i> to initiate communications with the IoT device</li> <li>iii) communication between the IoT device and all other internet locations, such as <i>https://unnamed-to.com</i> (by not mentioning this or any other URLs in the MUD file)</li> </ul> </li> </ul>

Test Case Field	Description
Procedure	<p>Note: Procedure steps with strike-through were not tested due to NAT.</p> <ol style="list-style-type: none"> <li>1. As stipulated in the preconditions, just before this test, test IoT-1-v4 must have been run successfully.</li> <li>2. Initiate communications from the IoT device to <i>https://yes-permit-to.com</i> and verify that this traffic is received at <i>https://yes-permit-to.com</i>. (egress)</li> <li><del>3. Initiate communications to the IoT device from <i>https://yes-permit-to.com</i> and verify that this traffic is received at the MUD PEP, but it is not forwarded by the MUD PEP, nor is it received at the IoT device. (ingress)</del></li> <li><del>4. Initiate communications to the IoT device from <i>https://yes-permit-from.com</i> and verify that this traffic is received at the IoT device. (ingress)</del></li> <li>5. Overall Results	Pass

IPv6 is not supported in this implementation.

#### 5.1.2.6 Test Case IoT-6-v4

**Table 5-7: Test Case IoT-6-v4**

Test Case Field	Description
Parent Requirement	<p>(CR-9) The IoT DDoS example implementation shall allow the MUD-enabled IoT device to communicate laterally with devices that are approved in the MUD file.</p> <p>(CR-10) The IoT DDoS example implementation shall deny lateral communications from a MUD-enabled IoT device to devices that are not approved in the MUD file (i.e., devices that are implicitly denied by virtue of not being explicitly approved).</p>
Testable Requirement	<p>(CR-9.a) The MUD-enabled IoT device shall attempt to initiate lateral traffic to approved devices.</p> <p>(CR-9.a.1) The router or switch shall receive the attempt and shall allow it to pass based on the filters from the MUD file.</p> <p>(CR-9.b) An approved device shall attempt to initiate a lateral connection to the MUD-enabled IoT device.</p> <p>(CR-9.b.1) The router or switch shall receive the attempt and shall allow it to pass based on the filters from the MUD file.</p> <p>(CR-10.a) The MUD-enabled IoT device shall attempt to initiate lateral traffic to unapproved (implicitly denied) devices.</p> <p>(CR-10.a.1) The router or switch shall receive the attempt and shall deny it based on the filters from the MUD file.</p> <p>(CR-10.b) An unapproved (implicitly denied) device shall attempt to initiate a lateral connection to the MUD-enabled IoT device.</p>

Test Case Field	Description
	(CR-10.b.1) The router or switch shall receive the attempt and shall deny it based on the filters from the MUD file.
Description	Shows that, upon connection to the network, a MUD-enabled IoT device used in the IoT DDoS example implementation has its MUD PEP router/switch automatically configured to enforce the route filtering that is described in the device's MUD file with respect to communication with lateral devices. Further shows that the policies that are configured on the MUD PEP router/switch with respect to communication with lateral devices will be enforced as expected, with communications that are configured as denied being blocked and communications that are configured as permitted being allowed.
Associated Test Case(s)	IoT-1-v4
Associated Cybersecurity Framework Subcategory(ies)	ID.AM-3, PR.DS-5, PR.AC-5, PR.IP-1, PR.PT-3, PR.IP-3, PR.DS-3
IoT Device(s) Under Test	Raspberry Pi
MUD File(s) Used	<i>mudfile-sensor.json</i>
Preconditions	<p>Test IoT-1-v4 has run successfully, meaning that the MUD PEP router/switch has been configured to enforce the following policies for the IoT device in question with respect to local communications (as defined in the MUD files in Section 5.1.3):</p> <ul style="list-style-type: none"> <li>a) Local-network class—Explicitly permit <b>local communication to and from the IoT device and any local hosts</b> (including the specific local hosts <i>anyhost-to</i> and <i>anyhost-from</i>) <b>for specific services</b>, as specified in the MUD file by source port: any; destination port: 80; and protocol: TCP, and which party initiates the connection.</li> <li>b) Manufacturer class—Explicitly permit <b>local communication to and from the IoT device and other classes of IoT devices</b>, as</li> </ul>

Test Case Field	Description
	<p><b>identified by their MUD URL (<i>www.devicetype.com</i>), and further constrained</b> by source port: any; destination port: 80; and protocol: TCP.</p> <ul style="list-style-type: none"> <li>c) Same-manufacturer class—Explicitly permit <b>local communication to and from IoT devices of the same manufacturer as the IoT device in question (the domain in the MUD URLs [mudfileservers] of the other IoT devices is the same as the domain in the MUD URL [mudfileservers] of the IoT device in question),</b> and further constrained by source port: any; destination port: 80; and protocol: TCP.</li> <li>d) Implicitly deny all other local communication that is not explicitly permitted in the MUD file, including denying <ul style="list-style-type: none"> <li>i) <b><i>anyhost-to</i> to initiate communications</b> with the IoT device</li> <li>ii) <b>the IoT device to initiate communications with <i>anyhost-to</i> by using a source port, destination port, or protocol (TCP or UDP) that is not explicitly permitted</b></li> <li>iii) <b>the IoT device to initiate communications with <i>anyhost-from</i></b></li> <li>iv) <b><i>anyhost-from</i> to initiate communications</b> with the IoT device by using a source port, destination port, or protocol (TCP or UDP) that is not explicitly permitted</li> <li>v) communications between the IoT device and all lateral hosts (including <i>unnamed-host</i>) whose <b>MUD URLs are not explicitly mentioned</b> as being permissible in the MUD file</li> <li>vi) communications between the IoT device and all lateral hosts whose <b>MUD URLs are explicitly mentioned</b> as being permissible <b>but using a source port, destination port, or protocol (TCP or UDP) that is not explicitly permitted</b></li> <li>vii) communications between the IoT device and all lateral hosts that are <b>not from the same manufacturer</b> as the IoT device in question</li> <li>viii) communications between the IoT device and a lateral host that <b>is from the same manufacturer but using a source port, destination port, or protocol (TCP or UDP) that is not explicitly permitted</b></li> </ul> </li> </ul>

Test Case Field	Description
Procedure	<ol style="list-style-type: none"> <li>1. As stipulated in the preconditions, just before this test, test IoT-1-v4 must have been run successfully.</li> <li>2. Overall Results	Pass

IPv6 is not supported in this implementation.

#### 5.1.2.7 Test Case IoT-9-v4

**Table 5-8: Test Case IoT-9-v4**

Test Case Field	Description
Parent Requirements	(CR-13) The IoT DDoS example implementation shall ensure that for each rule in a MUD file that pertains to an external domain, the MUD PEP router/switch will get configured with all possible instantiations of that rule, insofar as each instantiation contains one of the IP addresses to which the domain in that MUD file rule may be resolved when queried by the SDN-capable switch.

Test Case Field	Description
Testable Requirements	<p>(CR-13.a) The MUD file for a device shall contain a rule involving a domain that can resolve to multiple IP addresses when queried by the SDN-capable switch.</p> <p>Flow rules for permitting access to each of those IP addresses will be inserted into the SDN-capable switch, for the device in question, and the device will be permitted to communicate with all of those IP addresses.</p>
Description	<p>Shows that if a domain in a MUD file rule resolves to multiple IP addresses when the address resolution is requested by the router/switch, then</p> <ol style="list-style-type: none"> <li>1. flow rules instantiating that MUD file rule corresponding to each of these IP addresses will be configured in the switch for the IoT device associated with the MUD file, and</li> <li>2. the IoT device associated with the MUD file will be permitted to communicate with all the IP addresses to which that domain resolves</li> </ol>
Associated Test Case(s)	N/A
Associated Cybersecurity Framework Subcategory(ies)	ID.AM-1, ID.AM-2, ID.AM-3, PR.DS-5, DE.AE-1, PR.AC-4, PR.AC-5, PR.IP-1, PR.IP-3, PR.DS-2
IoT Device(s) Under Test	Raspberry Pi
MUD File(s) Used	<i>mudfile-sensor.json</i>
Preconditions	<ol style="list-style-type: none"> <li>1. The SDN-capable switch on the home/small-business network does not yet have any flow rules pertaining to the IoT device being used in the test.</li> <li>2. The MUD file for the IoT device being used in the test is identical to the MUD file provided in Section 5.1.3. (Therefore, the MUD file used in the test permits the device to send data to <i>www.updateserver.com</i>.)</li> </ol>

Test Case Field	Description
	<ol style="list-style-type: none"> <li>3. The DNS server that the switch uses resolves the domain <i>www.updateserver.com</i> to only one IP address.</li> <li>4. The tester has access to a DNS server that will be used by the SDN-capable switch and can configure it so that it will resolve the domain <i>www.updateserver.com</i> to any of these addresses when queried by the SDN-capable switch: x1.x1.x1.x1, y1.y1.y1.y1, and z1.z1.z1.z1.</li> <li>5. There is a server running at each of these three IP addresses.</li> </ol>
Procedure	<ol style="list-style-type: none"> <li>1. Verify that the SDN-capable switch on the home/small-business network does not yet have any flow rules installed with respect to the IoT device being used in the test.</li> <li>2. Run test IoT-1-v4. The result should be that the SDN-capable switch on the home/small-business network has been configured to explicitly permit the IoT device to initiate communication with <i>www.updateserver.com</i>.</li> <li>3. Attempt to reach <i>www.updateserver.com</i> on the device, and see that the SDN-capable switch is then configured with flow rules that permit the IoT device to send data to IP addresses x1.x1.x1.x1, y1.y1.y1.y1, and z1.z1.z1.z1.</li> <li>4. Have the device in question attempt to connect to x1.x1.x1.x1, y1.y1.y1.y1, and z1.z1.z1.z1.</li> </ol>
Expected Results	<p>The SDN-capable switch has had its configuration changed, i.e., it has been configured with flow rules that permit the IoT device to send data to multiple IP addresses (i.e., x1.x1.x1.x1, y1.y1.y1.y1, and z1.z1.z1.z1). The IoT device is permitted to send data to each of the servers at these addresses.</p>
Actual Results	<p>In this test, <i>www.nist.local</i> (an allowed internet interaction) resolved to two addresses (203.0.113.13 and 203.0.113.15). When the device attempted to reach <i>www.nist.local</i>, both IP addresses were allowed by the flows as intended.</p> <p>The flow rules relating to this interaction are shown below:</p>

Test Case Field	Description
	<p>cookie=0x95d11, duration=365.237s, table=2, n_packets=1, n_bytes=74, priority=40,tcp,metadata=0x400000000000/0xffff000000000000,nw_dst=203.0.113.13,tp_dst=443 actions=wr</p> <p>cookie=0x95d11, duration=365.141s, table=2, n_packets=6, n_bytes=493, priority=40,tcp,metadata=0x400000000000/0xffff000000000000,nw_dst=203.0.113.15,tp_dst=443 actions=w</p> <p>cookie=0x95d11, duration=365.220s, table=3, n_packets=0, n_bytes=0, priority=40,tcp,metadata=0x4000/0xffff000,nw_src=203.0.113.13,tp_src=443 actions=write_metadata:0xff</p> <p>cookie=0x95d11, duration=365.125s, table=3, n_packets=0, n_bytes=0, priority=40,tcp,metadata=0x4000/0xffff000,nw_src=203.0.113.15,tp_src=443 actions=write_metadata:0xff</p>
Overall Result	Pass

IPv6 is not supported in this implementation.

#### 5.1.2.8 Test Case IoT-10-v4

**Table 5-9: Test Case IoT-10-v4**

Test Case Field	Description
Parent Requirements	(CR-12) The IoT DDoS example implementation shall include a MUD manager that uses a cached MUD file rather than retrieve a new one if the cache-validity time period has not yet elapsed for the MUD file indicated by the MUD URL. The MUD manager should fetch a new MUD file if the cache-validity time period has already elapsed.
Testable Requirements	<p>(CR-12.a) The MUD manager shall check if the file associated with the MUD URL is present in its cache and shall determine that it is.</p> <p>(CR-12.a.1) The MUD manager shall check whether the amount of time that has elapsed since the cached file was retrieved is less than or equal</p>

Test Case Field	Description
	to the number of hours in the cache-validity value for this MUD file. If so, the MUD manager shall apply the contents of the cached MUD file. (CR-12.a.2) The MUD manager shall check whether the amount of time that has elapsed since the cached file was retrieved is greater than the number of hours in the cache-validity value for this MUD file. If so, the MUD manager may (but does not have to) fetch a new file by using the MUD URL received.
Description	Shows that, upon connection to the network, a MUD-enabled IoT device used in the IoT DDoS example implementation has its MUD PEP router/switch automatically configured to enforce the route filtering that is described in the cached MUD file for that device's MUD URL, assuming that the amount of time that has elapsed since the cached MUD file was retrieved is less than or equal to the number of hours in the file's cache-validity value. If the cache validity has expired for the respective file, the MUD manager should fetch a new MUD file from the MUD file server.
Associated Test Case(s)	N/A
Associated Cybersecurity Framework Subcategory(ies)	ID.AM-1, ID.AM-2, ID.AM-3, PR.DS-5, DE.AE-1, PR.AC-4, PR.AC-5, PR.IP-1, PR.IP-3, PR.DS-2, PR.PT-3
IoT Device(s) Under Test	Raspberry Pi
MUD File(s) Used	<i>mudfile-sensor.json</i>
Preconditions	<ol style="list-style-type: none"> <li>1. All devices have been configured to use IPv4.</li> <li>2. The MUD PEP router/switch does not yet have any configuration settings pertaining to the IoT device being used in the test.</li> <li>3. The MUD file for the IoT device being used in the test is identical to the MUD file provided in Section 5.1.3.</li> </ol>
Procedure	Verify that the MUD PEP router/switch for the IoT device to be used in the test does not yet have any configuration settings installed with respect to the IoT device being used in the test.

Test Case Field	Description
	<ol style="list-style-type: none"> <li>1. Run test IoT-1-v4.</li> <li>2. Within 24 hours (i.e., within the cache-validity period for the MUD file) of running test IoT-1-v4, verify that the IoT device that was connected during test IoT-1-v4 is still up and running on the network. Power on a second IoT device that has been configured to emit the same MUD URL as the device that was connected during test IoT-1-v4, and connect it to the test network.</li> <li>3. On the IoT device, emit a DHCPv4 message containing the device's MUD URL (IANA code 161).</li> <li>4. The MUD manager snoops the DHCP request through the switch and extracts the MUD URL from the DHCP request.</li> <li>5. The DHCP server receives the DHCPv4 message containing the IoT device's MUD URL.</li> <li>6. The DHCP server offers an IP address lease to the newly connected IoT device.</li> <li>7. The IoT device requests this IP address lease, which the DHCP server acknowledges.</li> <li>8. The MUD manager determines that it has this MUD file cached and checks that the amount of time that has elapsed since the cached file was retrieved is less than or equal to the number of hours in the cache-validity value for this MUD file. If the cache validity has been exceeded, the MUD manager will fetch a new MUD file.</li> <li>9. The MUD manager translates the MUD file's contents into appropriate route filtering rules and installs these rules onto the MUD PEP for the IoT device in question so that this router/switch is now configured to enforce the policies specified in the MUD file.</li> </ol>
Expected Results	<p>The MUD PEP router/switch for the IoT device has had its configuration changed, i.e., it has been configured to enforce the policies specified in the IoT device's MUD file. The expected configuration should resemble the following details:</p> <p><b>Cache is valid</b> (the MUD manager does NOT retrieve the MUD file from the MUD file server):</p>

Test Case Field	Description
	<p>Observing the MUD file server logs, notice that only the first DHCP request for a device goes out to the MUD file server. Within the next 24 hours, any additional DHCP requests will not go to the MUD file server to fetch a new MUD file.</p> <p><b>Cache is not valid</b> (the MUD manager does retrieve the MUD file from the MUD file server):</p> <p>Observing the MUD file server logs, notice that the MUD manager fetches a new copy of the MUD file and signature when the cache does not contain the MUD file of interest.</p>

Overall Results	Pass

IPv6 is not supported in this implementation.

#### 5.1.2.9 Test Case IoT-11-v4

**Table 5-10: Test Case IoT-11-v4**

Test Case Field	Description
Parent Requirements	(CR-1) The IoT DDoS example implementation shall include a mechanism for associating a device with a MUD file URL (e.g., by having the MUD-enabled IoT device emit a MUD file URL via DHCP, LLDP, or X.509 or by using some other mechanism to enable the network to associate a device with a MUD file URL).
Testable Requirements	(CR-1.a) Upon initialization, the MUD-enabled IoT device shall broadcast a DHCP message on the network, including at most one MUD URL, in https scheme, within the DHCP transaction.

Test Case Field	Description
	(CR-1.a.1) The DHCP server shall be able to receive DHCPv4 DISCOVER and REQUEST with IANA code 161 (OPTION_MUD_URL_V4) from the MUD-enabled IoT device.
Description	Shows that the IoT DDoS example implementation includes IoT devices that can emit a MUD URL via DHCP.
Associated Test Case(s)	N/A
Associated Cybersecurity Framework Subcategory(ies)	ID.AM-1
IoT Device(s) Under Test	Raspberry Pi 1
MUD File(s) Used	<i>nistmud1.json</i>
Preconditions	Device has been developed to emit MUD URL in DHCP transaction.
Procedure	<ol style="list-style-type: none"> <li>1. Power on a device and connect it to the network.</li> <li>2. Verify that the device emits a MUD URL in a DHCP transaction. (Use Wireshark to capture the DHCP transaction with options present.)</li> </ol>
Expected Results	DHCP transaction with MUD option 161 enabled and MUD URL included
Actual Results	 <p>Wireshark packet capture showing a DHCP transaction. The packet list shows a DHCP Discover (346) and a DHCP Offer (346) from 10.0.0.0 to 10.0.0.0. The packet details show the DHCP Offer with options including MUDURL: https://sensor.nist.local/nistmud1. The packet bytes show the raw data of the DHCP Offer.</p>

Test Case Field	Description
Overall Results	Pass

### 5.1.3 MUD Files

This section contains the MUD files that were used in the Build 4 functional demonstration.

#### 5.1.3.1 *mudfile-sensor.json*

The complete mudfile-sensor.json MUD file has been linked to this document. To access this MUD file please click the link below.
