
IT ASSET MANAGEMENT

Securing Assets for the Financial Services Sector

Draft
November 18, 2013
financial_nccoe@nist.gov

The National Cybersecurity Center of Excellence (NCCoE) at the National Institute of Standards and Technology works with industry, academic and government experts to find practical solutions for businesses' most pressing cybersecurity needs. The NCCoE collaborates to build open, standards-based, modular, end-to-end reference designs that are broadly applicable and help businesses more easily align with relevant standards and best practices.

This document is a detailed description of a particular problem that is relevant across the financial services sector. NCCoE cybersecurity experts will address this challenge through collaboration with members of the sector and vendors of cybersecurity solutions. The solutions proposed by this effort will not be the only ones available in the fast-moving cybersecurity technology market. If you would like to propose an alternative architecture or know of products that might be applicable to this challenge, please contact us at financial_nccoe@nist.gov.

1 1. DESCRIPTION

2 Goal

3 To effectively manage, utilize and secure an asset, you first need to know the asset's
4 location and function. While many financial sector companies label physical assets with
5 bar codes and track them with a database, this approach does not answer questions
6 such as, "What operating systems are our laptops running?" and "Which devices are
7 vulnerable to the latest threat?" The goal of this project is to provide answers to
8 questions like these by tying existing data systems for physical assets and security and IT
9 security and support into a comprehensive IT asset management (ITAM) system. In
10 addition, financial services companies can employ this ITAM system to dynamically
11 apply business and security rules to better utilize information assets and protect
12 enterprise systems and data. In short, this ITAM system will give companies the ability
13 to track, manage and report on an information asset throughout its entire life cycle.

14 Motivation

15 Financial services companies, like most U.S. industries, design their asset management
16 practices around the key physical products and intellectual property residing within the
17 internal corporate environment they own, control and manage.

18 An effective ITAM system increases security by providing visibility into what assets are
19 present and what they are doing. Organizations are collecting more asset-related data
20 than ever before, but often have a difficult time turning that data into actionable
21 information. Records related to assets are stored in numerous locations such as asset
22 databases, configuration systems, vulnerability scanners, network monitoring tools and
23 patch managers. This ITAM system provides a complete picture by combining data from
24 asset management along with data from various monitoring tools. Following a security
25 incident, the security analyst can utilize the ITAM system to track an alert down to the

26 exact location, machine, software and user. A properly administered and implemented
 27 ITAM system addresses the top three SANS security controls¹ and delivers more
 28 effective resource utilization, patch management and policy enforcement.

29 Example Scenarios

30 Scenario 1: A new laptop computer is purchased

31 In this scenario, the ITAM system will access data from a physical asset management
 32 system, Active Directory and the laptop.

- 33 • **Phase 1** – When a new laptop is acquired, an asset manager records certain data
 34 attributes in a traditional physical asset management system before provisioning.
 35 Attributes might include the laptop make, model, price/value, location, business unit
 36 and owner, or other characteristics.
- 37 • **Phase 2** – The asset manager submits the new laptop to IT support for provisioning.
 38 IT support equips the new laptop with the company’s baseline load of an operating
 39 system, software and required configurations. Load may include ITAM system
 40 software. IT support also adds the new laptop to the enterprise Active Directory
 41 during this phase.
- 42 • **Phase 3** – IT support assigns and delivers the new laptop to an end user. The end
 43 user can now add additional software—in accordance with company policy
 44 (enforced via ITAM or existing mechanisms linked to ITAM)—and make personal
 45 configuration changes (e.g., backgrounds, icons, menus, etc.). The ITAM system will
 46 detect and log any changes made to the laptop and will automatically update
 47 relevant administrative systems.

48 Scenario 2: A server is transferred from one department to another

49 In this scenario the ITAM system will be used to update a physical asset management
 50 system, Active Directory and the server itself.

- 51 • **Phase 1** - Assume that the server is already part of the ITAM system and has the
 52 required software installed. The development department generates a work order
 53 to IT support ordering the server transferred from the development department to
 54 the sales department.
- 55 • **Phase 2** – IT support updates the software baseline of the server by removing
 56 software needed by the development department and adding software required by
 57 the sales department. The ITAM system updates its records during this process as
 58 changes are made.
- 59 • **Phase 3** – IT support uses the ITAM system to update ownership information
 60 pertaining to the server. The ITAM system uses this new information to update
 61 other required systems, such as the physical asset management system.

¹ SANS 20 Critical Security Controls: <http://www.sans.org/critical-security-controls/>

- 62 • **Phase 4** – The destination department receives their new server that has been
 63 correctly configured and added to the inventory. The ITAM system detects and logs
 64 any changes made on the server while it is in use and automatically updates the
 65 required systems. The ITAM system also detects and reports on all assets running on
 66 the server, such as virtual machines and applications.

67 **Scenario 3: A virtual machine migrates between physical servers**

68 In this scenario a virtual machine will be moved from physical server 1 to physical server
 69 2.

- 70 • **Phase 1** – The hypervisor determines that a virtual machine needs to be migrated
 71 due to impending maintenance on server 1. The hypervisor, in coordination with
 72 ITAM, determines that server 2 is an appropriate location and begins the migration
 73 process.
- 74 • **Phase 2** – Just after the hypervisor completes the migration process and the virtual
 75 machine is now running on server 2, the ITAM system recognizes the change and
 76 updates the appropriate administrative systems.

77 **Scenario 4: Incident response and prevention**

78 In this scenario a vulnerability advisory is received describing a particular piece of
 79 software with a critical vulnerability. A software patch is also available to prevent this
 80 vulnerability.

- 81 • **Phase 1** – The software mentioned in the advisory is added to the “blacklist” of
 82 unauthorized software for the enterprise.
- 83 • **Phase 2** – The ITAM system then scans to determine if any systems have the
 84 vulnerable software installed. A report is generated identifying the vulnerable assets
 85 and those assets are moved off of the production network into a quarantine zone.
- 86 • **Phase 3** – The patch is entered into the existing enterprise patch management
 87 system and pushed out to all machines (including those in the quarantine zone).
- 88 • **Phase 4** – The ITAM system performs another scan to determine if any systems still
 89 have the vulnerable software installed (effectively double checking that the patch
 90 management system was effective). A report is generated identifying any assets
 91 that are still vulnerable. If a system is still vulnerable, manual patching or other
 92 remediation may be necessary.
- 93 • **Phase 5** – Clean systems are moved back into the production network.

94 **2. DESIRED SOLUTION CHARACTERISTICS**

95 The ITAM system will

- 96 • be capable of interfacing with multiple existing systems
- 97 • complement existing asset management, security and network systems

- 98 • provide APIs for communicating with other security devices and systems such as
- 99 firewalls and intrusion detection and identity and access management (IDAM)
- 100 systems
- 101 • know and control which assets, both virtual and physical, are connected to the
- 102 enterprise network
- 103 • detect and alert when unauthorized devices attempt to access the network
- 104 • integrate with ways to validate a trusted network connection
- 105 • enable administrators to define and control the hardware and software that can
- 106 be connected to the corporate environment
- 107 • enforce software restriction policies relating to what software is allowed to run
- 108 in the corporate environment
- 109 • record and track the prescribed attributes of assets
- 110 • audit and monitor changes in the asset's state and connection
- 111 • integrate with log analysis tools to collect and store audited information

112 3. BUSINESS VALUE

113 A properly implemented and administered ITAM system can:

- 114 • enhance visibility – know where assets are and how they are configured
- 115 • improve asset management by reporting on asset utilization – save money by
- 116 removing underutilized computing assets
- 117 • mitigate operational and regulatory risk by providing better accounting and
- 118 reporting of assets, thereby reducing opportunities for exploitation
- 119 • reveal the software that is actually used, allowing for savings on licenses
- 120 • centralize views of enterprise-wide activity and security alerts
- 121 • join existing asset management systems with enabling technologies such as
- 122 automated endpoint visibility, access and security
- 123 • allow asset-related questions to be answered quickly and accurately
 - 124 ○ For example, questions such as “Which systems are running Windows 7
 - 125 SP1?” can be answered in minutes with an ITAM system.

126 4. RELEVANT STANDARDS

- 127 • NIST Cybersecurity Framework - Standards, guidelines, and best practices to
- 128 promote the protection of critical infrastructure
- 129 <http://www.nist.gov/itl/cyberframework.cfm>
- 130 • ASTM Asset Management Standards
- 131 <http://www.astm.org/Standards/asset-management-standards.html>

- 132 • ISO 55000 International Standard for Asset Management
133 <http://www.assetmanagementstandards.com/>
- 134 • ISO Standards for Software Asset Management, ISO/IEC 19770-1:2006 SAM
135 Processes
136 <https://www.microsoft.com/sam/en/us/iso.aspx>
- 137 • PAS55 Asset Management
138 <http://pas55.net/>
- 139 • ISO/IEC 19770 International Standards about Software Asset Management
140 <http://www.19770.org>
- 141 • SANS 20 Critical Security Controls
142 <http://www.sans.org/critical-security-controls/>
- 143 • NIST SP 800-53, Security and Privacy Controls for Federal Information Systems
144 and Organizations
145 <http://nvlpubs.nist.gov/nistpubs/SpecialPublications/NIST.SP.800-53r4.pdf>

146 **5. SECURITY CONTROL MAP**

Security Characteristic	NIST 800-53 Security Controls	SANS 20 Security Controls
Be capable of interfacing with multiple existing systems	AC-1 Access Control Policy and Procedures AC-2 Account Management AC-3 Access Enforcement	
Complement existing asset management, security and network systems	AC-20 Use of External Information System	15 - Account Access Based on Need to Know 16 - Account Monitoring and Control
Provide APIs for communicating with other security devices and systems such as firewalls and intrusion detection and identity and access management (IDAM) systems		
Know and control which assets, both virtual and physical, are connected to the enterprise network	CA-7 Continuous Monitoring CM-3 Configuration Change Control IA-3 Device Identification and Authentication IA-4 Identifier Management SC-7 Boundary Protection SC-30 Virtualization Techniques SC-32 Information System Partitioning	1 - Inventory of Authorized and Unauthorized Devices 4 - Continuous Vulnerability Assessment and Remediation 13 - Boundary Defense 19 - Secure Network Engineering

147

Security Characteristic	NIST 800-53 Security Controls	SANS 20 Security Controls
Detect and alert when unauthorized devices attempt to access the network	AU-2 Auditable Events AU-3 Content of Audit Records CA-7 Continuous Monitoring IA-3 Device Identification and Authentication IA-4 Identifier Management IR-5 Incident Monitoring IR-6 Incident Reporting	1 - Inventory of Authorized and Unauthorized Devices 4 - Continuous Vulnerability Assessment and Remediation 13 - Boundary Defense 19 - Secure Network Engineering
Integrate with ways to validate a trusted network connection	AU-2 Auditable Events CA-7 Continuous Monitoring IA-3 Device Identification and Authentication IR-5 Incident Monitoring IR-6 Incident Reporting PE-4 Access Control for Transmission Medium	
Enable administrators to define and control the hardware and software that can be connected to the corporate environment	IA-3 Device Identification and Authentication IA-4 Identifier Management	1 - Inventory of Authorized and Unauthorized Devices 2 - Inventory of Authorized and Unauthorized Software 4 - Continuous Vulnerability Assessment and Remediation 13 - Boundary Defense 19 - Secure Network Engineering
Enforce software restriction policies relating to what software is allowed to run in the corporate environment	AC-16 Security Attributes MP-2 Media Access	2 - Inventory of Authorized and Unauthorized Software

Security Characteristic	NIST 800-53 Security Controls	SANS 20 Security Controls
Record and track the prescribed attributes of assets	CA-7 Continuous Monitoring SI-4 Information System Monitoring	
Audit and monitor changes in the asset's state and connection	CA-7 Continuous Monitoring SI-4 Information System Monitoring	14 - Maintenance, Monitoring and Analysis of Audit Logs 18 - Incident Response and Management
Integrate with log analysis tools to collect and store audited information	IR-5 Incident Monitoring IR-6 Incident Reporting	14 - Maintenance, Monitoring and Analysis of Audit Logs 18 - Incident Response and Management
Utilizes secure communications between all components	SC-8 Transmission Integrity SC-9 Transmission Confidentiality SC-12 Cryptographic Key Establishment and Management SC-13 Use of Cryptography SC-17 Public Key Infrastructure Certificates SC-23 Session Authenticity	19 - Secure Network Engineering
Does not introduce new attack vectors into existing systems	RA-5 Vulnerability Scanning SI-7 Software and Information Integrity SC-3 Security Function Isolation SA-11 Developer Security Testing	19 - Secure Network Engineering

149 **6. COMPONENT LIST**

150 The NCCoE has a test environment for hosting development of the use case including
 151 the following features:

- 152 • Network with machines using Active Directory
- 153 • Virtualization servers
- 154 • Network switches
- 155 • Remote access solution with Wi-Fi and VPN

156 Partners will need to provide any specialized components and capabilities to realize this
 157 use case including, but not limited to:

- 158 • Physical asset management system/database
- 159 • Physical security management system/database
- 160 • Multiple virtual testing networks and systems simulating receiving, security, IT
 161 support, network security, development and sales departments
- 162 • Physical access controls with standard network interfaces

163 **7. HIGH-LEVEL ARCHITECTURE**

164
