# CAPABILITIES ASSESSMENT FOR SECURING MANUFACTURING INDUSTRIAL CONTROL SYSTEMS

## Cybersecurity for Manufacturing

---

Keith Stouffer

NIST National Cybersecurity Center of Excellence (NCCoE)

DRAFT  
November 7, 2016  
[Manufacturing\\_NCCoE@nist.gov](mailto:Manufacturing_NCCoE@nist.gov)

The National Cybersecurity Center of Excellence (NCCoE) at the National Institute of Standards and Technology (NIST) addresses businesses' most pressing cybersecurity problems with practical, standards-based solutions using commercially available technologies. The NCCoE collaborates with experts from industry, academia, and the government to build modular, open, end-to-end reference designs that are broadly applicable and repeatable. To learn more about the NCCoE, visit <http://nccoe.nist.gov>. To learn more about NIST, visit <http://www.nist.gov>.

This document describes a particular problem that is relevant across the manufacturing sector. NCCoE cybersecurity experts will address this challenge through collaboration with members of various manufacturing sectors and vendors of cybersecurity solutions. The resulting reference design will detail an approach that can be used by manufacturing sector organizations.

### ABSTRACT

Industrial Control Systems (ICS) monitor and control physical processes in many different industries and sectors. Cyber-attacks against ICS devices present a real threat to organizations that employ ICS to monitor and control manufacturing processes. The NIST Engineering Laboratory, in conjunction with the National Cybersecurity Center of Excellence, will produce a series of reference designs demonstrating four cybersecurity capabilities for manufacturing organizations. Each reference design will highlight an individual capability: Behavioral Anomaly Detection, ICS Application Whitelisting, Malware Detection and Mitigation, and ICS Data Integrity. This document is part one of a four-part series and addresses only behavioral anomaly detection capabilities.

With these capabilities in place, manufacturers will find it easier to detect anomalous conditions, control what programs and applications are executed in their operating environments, mitigate or vanquish malware attacks, and ensure the integrity of critical operational data.

For each of the four capabilities listed above, the NCCoE will map the security characteristics to the NIST Cyber Security Framework, which will provide standards-based security controls for manufacturers. In addition, the NCCoE will implement each of the capabilities in two distinct but related lab settings: a robotics-based manufacturing enclave, and a process control enclave, similar to what is being used by chemical manufacturing industries.

This project will result in a publicly available NIST Cybersecurity Practice Guide, a detailed implementation guide of the practical steps needed to implement the cybersecurity reference design that addresses this challenge.

### KEYWORDS

*behavioral anomaly, control processes, Cyber Security Framework, CSF, industrial control system(s), ICS, manufacturing*

**DISCLAIMER**

Certain commercial entities, equipment, products, or materials may be identified in this document in order to describe an experimental procedure or concept adequately. Such identification is not intended to imply recommendation or endorsement by the National Institute of Standards and Technology or the National Cybersecurity Center of Excellence, nor is it intended to imply that the entities, equipment, products, or materials are necessarily the best available for the purpose.

**COMMENTS ON NCCoE DOCUMENTS**

Organizations are encouraged to review all draft publications during public comment periods and provide feedback. All publications from NIST's National Cybersecurity Center of Excellence are available at <http://nccoe.nist.gov>.

Comments on this publication may be submitted to: [Manufacturing\\_NCCoE@nist.gov](mailto:Manufacturing_NCCoE@nist.gov)

Public comment period: *November 7, 2016 to December 7, 2016*

## 1    **1.    EXECUTIVE SUMMARY**

### 2    **Purpose**

3    This is the first of a four-part series designed to provide businesses with the information  
4    they need to establish an anomaly detection and prevention capability in their own  
5    environments. This project will be using commercially available software deployed on an  
6    established lab infrastructure. It will produce a mapping of security characteristics to the  
7    National Institute of Standards and Technology (NIST) Cyber Security Framework (CSF)  
8    to establish a baseline that can be associated with specific security controls in  
9    prominent industry standards and guidance.

10    A cyber-attack directed at manufacturing infrastructure could result in detrimental  
11    consequences to both human life and property. Behavioral anomaly detection and  
12    prevention mechanisms can support a multi-faceted approach to counteracting cyber-  
13    attacks against Industrial Control Systems (ICS) devices that provide the functionality  
14    necessary to run manufacturing processes.

15    The goal of this project is to provide businesses with a cybersecurity reference design  
16    that can be implemented or that can inform improved cybersecurity in their  
17    manufacturing processes. We believe guarding against cyber-attacks will reduce costs  
18    for businesses that depend on these processes. Implementing behavioral anomaly  
19    detection tools provides a key security component in sustaining business operations,  
20    particularly those based on ICS. One of the ways to disrupt operations is to introduce  
21    anomalous data into a manufacturing process, whether deliberately or inadvertently.  
22    Although the reference design will focus on cybersecurity, our example solution may  
23    also produce residual benefit to manufacturers for detecting anomalous conditions not  
24    related to security.

### 25    **Scope**

26    This use case will focus on a single cybersecurity capability: behavioral anomaly  
27    detection. The NCCoE will deploy commercially available behavioral anomaly detection  
28    tools in two distinct but related manufacturing lab environments: a robotics enclave and  
29    a simulated chemical process enclave. The security characteristics of behavioral  
30    anomaly detection will be mapped to the CSF, which will point manufacturers to specific  
31    security controls found in prominent cybersecurity standards. This project will result in a  
32    NIST Cybersecurity Practice Guide, a detailed reference design document that will  
33    measure the performance of the behavioral anomaly detection tools and demonstrate  
34    how manufacturing companies can implement the capability in their own operational  
35    environments.

### 36    **Assumptions/Challenges**

37    The following assumptions and challenges will help shape the scope of the project and  
38    provide controlled parameters for the effort such that the focus is centered on

39 delivering a successful solution based closely on the manufacturing operational  
40 environment.

#### 41 **Assumptions**

- 42 • Manufacturing lab infrastructure is in place
- 43 • Numerous commercially available products exist in the market to demonstrate  
44 reference design

#### 45 **Challenges**

- 46 • Findings may need to be extrapolated for large-scale manufacturing processes as  
47 the lab provides only a small-scale environment
- 48 • Lab environment consistency must be ensured as performance metrics of the  
49 products introduced are recorded and published

#### 50 **Background**

51 The risk of cyber-attacks directed at ICS-based manufacturing infrastructures and  
52 processes is a great concern to companies who produce goods, particularly those made  
53 for public consumption. NIST recognizes this concern and is working with industry to  
54 solve these challenges through the implementation of cybersecurity technologies. In  
55 addition to this challenge, NIST provides the CSF for any manufacturing entity interested  
56 in enhancing the security of its infrastructure. The CSF is a valuable resource to those  
57 determining their next cybersecurity investment. This project will build an example of  
58 the implementation of a behavioral anomaly detection capability that manufacturers  
59 can adopt to achieve their cybersecurity goals.

## 60 **2. SCENARIOS**

### 61 **Scenario 1: Robotics Enclave - Detecting anomalous conditions on a robotic-based** 62 **manufacturing process**

63 The robotics enclave contains a robotic assembly system in which industrial robots work  
64 cooperatively to move parts through a simulated manufacturing operation. The robots  
65 work according to a plan that changes dynamically based on process feedback. The  
66 robotic enclave includes two small, industrial grade robots and a supervisory  
67 Programmable Logic Controller (PLC) with safety processing. Additional information on  
68 the robotics enclave can be found at  
69 <http://nvlpubs.nist.gov/nistpubs/ir/2015/NIST.IR.8089.pdf>.

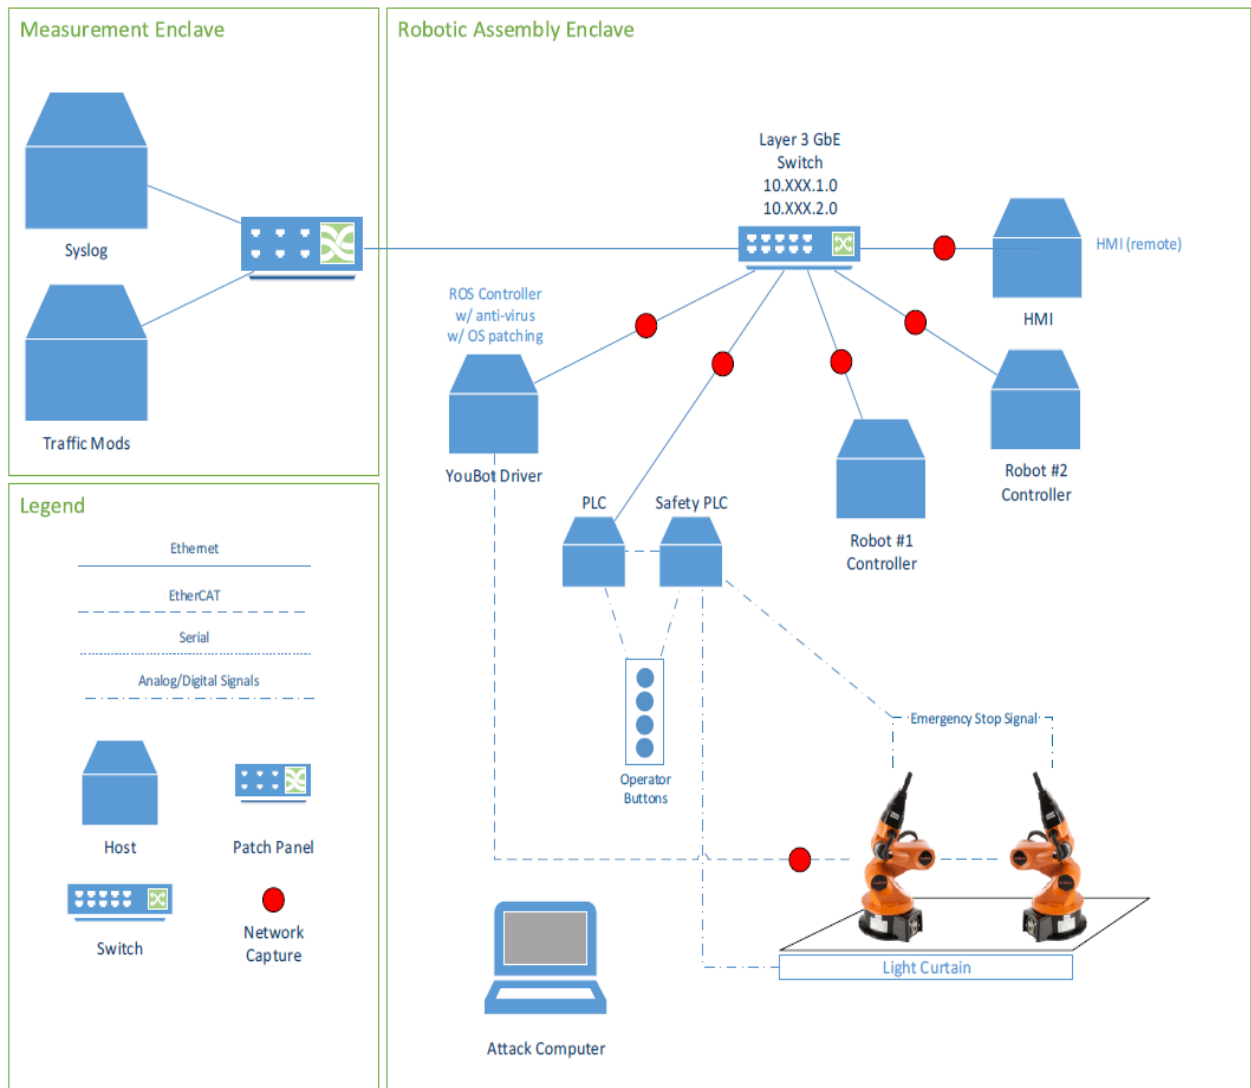

### 70 **Scenario 2: Detecting anomalous conditions on a chemical manufacturing process**

71 The process control enclave uses the Tennessee Eastman (TE) control problem as the  
72 continuous process model. The TE model is a well-known plant model used in control  
73 systems research, and the dynamics of the plant process are well understood. The  
74 process must be controlled—perturbations will drive the system into an unstable state.  
75 The inherent unstable open-loop operation of the TE process model presents a real-

76 world scenario in which a cyber-attack could present a real risk to human and  
 77 environmental safety, as well as economic viability. The process is complex and  
 78 nonlinear, and has many degrees of freedom by which to control and disturb the  
 79 dynamics of the process. Numerous simulations of the TE process have been developed  
 80 with readily available reusable code. Additional information on the process control  
 81 enclave can be found at <http://nvlpubs.nist.gov/nistpubs/ir/2015/NIST.IR.8089.pdf>.

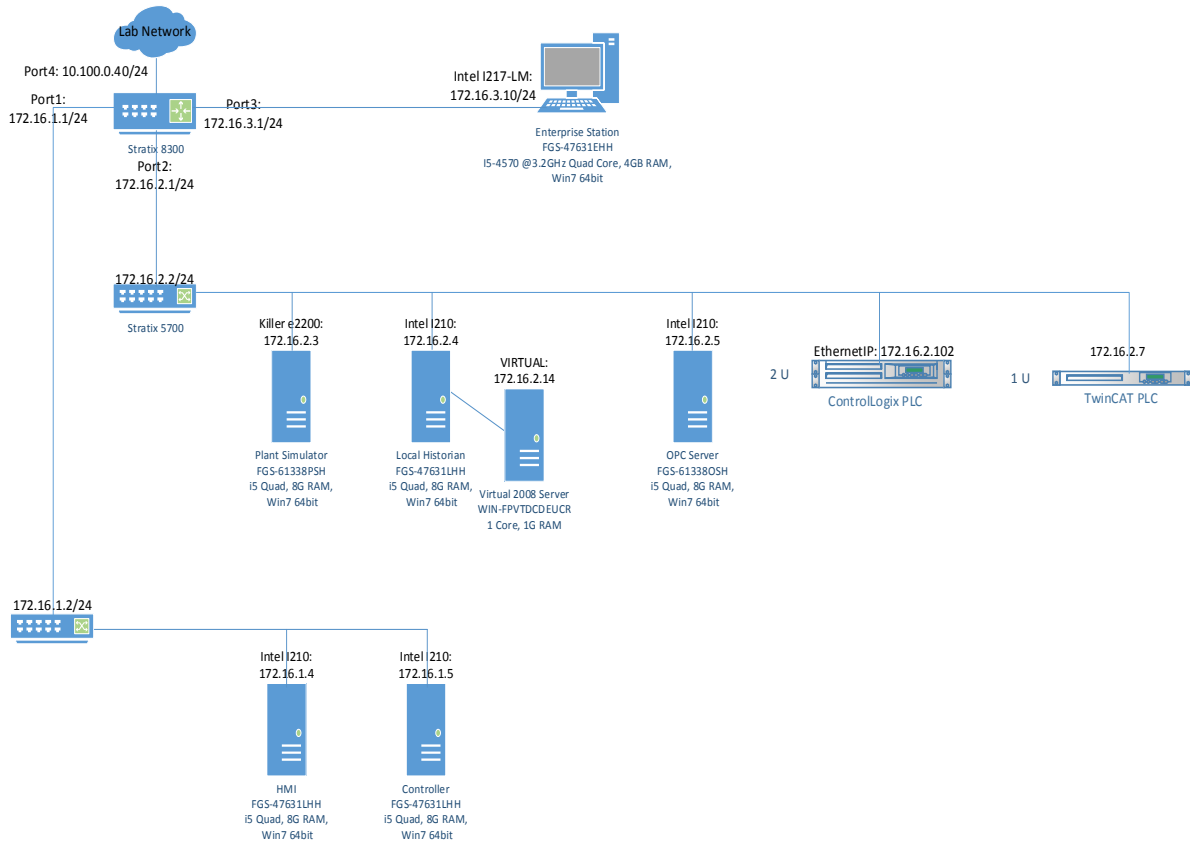

### 82 3. HIGH-LEVEL ARCHITECTURES

#### 83 Robotics Enclave

91 **Component List**

- 92 • ICS behavioral anomaly detection tools
- 93 • ICS application whitelisting tools
- 94 • ICS malware detection and mitigation tools
- 95 • ICS data integrity validation tools
- 96 • Human Machine Interfaces (HMIs)
- 97 • Programmable Logic Controllers (PLCs)
- 98 • Security Information and Event Management (SIEM) platform

99 **Desired Requirements**

- 100 • Detection of anomalous conditions
- 101 • Assurance of data integrity

- 102 • Detection of unauthorized applications
- 103 • Detection and mitigation of malware
- 104 • Detection of unauthorized data modification
- 105 • Process and/or device damage prevention
- 106 • Alerting/alarming capability
